Preparations

Overview

The chapter describes the preparations for the WEB configuration of MyPower S3400 series switch.

Note

The browser that supports the web configuration described in the chapter is Internet Explorer 6.0 or above.

Login

The web management system of the gateway supports two kinds of users, including administrator and common users. The MyPower S3400 series switch described in the manual does not have default user name or password, so you need to telnet to the gateway and configure login user in shell so that the web management system can be used normally. The following are the shell commands for configuring users.

Configure administrator:

```
MyPower S3400#configure terminal //enter into the
configuration mode
```

```
MyPower S3400(config)#user admin privilege 15 password 0 admin
//configure the administrator with user name as admin, priority as
15, and password as admin. 15 is the highest priority.
```

Configure common users:

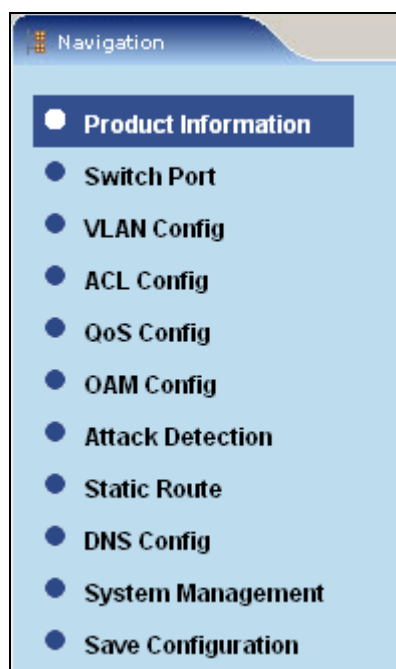

```
MyPower S3400#configure terminal // enter into the
configuration mode
```

```
MyPower S3400(config)#user guest privilege 0 password 0 guest
//configure the user with user name as guest, priority as 0, and
password as guest. 0 is the lowest priority.
```

The administrator and common user correspond to different management authorities.

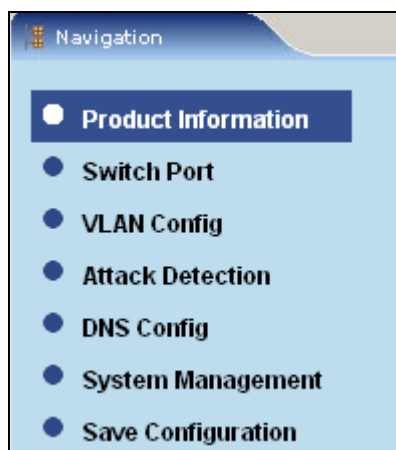

The administrator authorities include switch port configuration, VLAN configuration, ACL configuration, QoS configuration, OAM configuration, anti-attack detection configuration, DNS configuration, system management, and save configuration.

The corresponding function navigation is as follows:

The authorities of the common user include switch port configuration, VLAN configuration, anti-attack detection configuration, DNS configuration, system management, and save configuration.

The corresponding function navigation is as follows:

Product Information

Overview

The chapter describes the features and version information of MyPower S3400 series switch.

Features

MyPower S3400 series switch provides telecom-level Ethernet access switches for operators. It supports next generation L2 and L3 features and meets the requirements of customers for QoS, OAM, VPN, Multi-service and Protection.

S3400 can help customers develop IPTV, VoIP, VPN, wireless access and TDMoIP services. The high integrated platform design meets the requirement of the customer that a box provides rich physical interface and software features to reduce the total cost (TCO) and operating expenses (OpEx).

MyPower S3400 is the first in the world to adopt dual power supply, high integrated E1/T1 interface, standard PoE, and optical-electric Ethernet access on the access device. The operators adopt it to be deployed in 2G/3G base station for developing multi-service access (wireless, VPN, and mobile) and completing the reconstruction from TDM to IP.

S3400 has the following features:

Multi-service Ethernet switch with highest integrity

First to support dual power supply on access-level Ethernet device

Supports perfect OAM protocol

Supports VPN services defined by MEF

50ms Ethernet service protection

Supports QinQ and selective QinQ

Supports UDLD and improves operation and maintenance capabilities

Supports rich L2 and L3 protocols

Supports PoE and TDMoIP

You can view via , as follows:

Welcome To MAIPU MyPower S3400 Series Switch

MyPower S3400 series switch provides telecom-level Ethernet access switches for operators. It supports next generation L2 and L3 features meets the requirements of customers for QoS, OAM, VPN, Multi-service and Protection. S3400 can help customers develop IPTV, VoIP, VPN, wireless access and TDMoIP services. The high integrated platform design meets the requirement of the customer that a box provides rich physical interface and software features to reduce the total cost (TCO) and operating expenses (OpEx). MyPower S3400 is the first in the world to adopt dual power supply, high integrated E1/T1 interface, standard PoE, and optical-electric Ethernet access on the access device. The operators adopt it to be deployed in 2G/3G base station for developing multi-service access (wireless, VPN, and mobile) and completing the reconstruction from TDM to IP. Key Features:

- **Multi-service Ethernet switch with highest integrity**
- **First to support dual power supply on access-level Ethernet device**
- **Supports perfect OAM protocol**
- **Supports VPN services defined by MEF**
- **50ms Ethernet service protection**
- **Supports QinQ and selective QinQ**
- **Supports UDLD and improves operation and maintenance capabilities**
- **Supports rich L2 and L3 protocols**
- **Supports PoE and TDMoIP**

System Version Information

You can view the current system version information via

<input type="checkbox"/>	0/5		disabled	down	auto	unkown	auto	unkown	off	off	auto	1728	0	5	
<input type="checkbox"/>	0/6		enabled	up	auto	100	auto	full	off	off	auto	1728	0	1	
<input type="checkbox"/>	0/7		disabled	down	auto	unkown	auto	unkown	off	off	auto	1728	0	1	
<input type="checkbox"/>	0/8		disabled	down	auto	unkown	auto	unkown	off	off	auto	1728	0	1	
<input type="checkbox"/>	0/9		disabled	down	auto	unkown	auto	unkown	off	off	auto	1728	0	1	

Port: The numbers of all ports in the switch;

Description: The port description information for easy memory. You can configure the description information for one port. For example, one port is distributed to Company A and you can configure the description information as "company A". The description information comprises up to 240 characters and there can be blanks between the characters. By default, the port does not have description information;

Status: Port status. When the value is enabled, it indicates that the port is enabled; when the value is disabled, it indicates that the port is disabled and cannot enter into the normal working state. The default value is enabled.

Link: The physical status of the port. By default, after the port is connected, the light is on and the link status is UP; when the port is not connected, the link status is down.

Set speed: The management speed of the port, including "10", "100", "1000", and "auto". Unit is M. "auto" means "auto-negotiation";

Act speed: The actual speed of the port, including "10", "100", "1000", and "auto". Unit is M. "auto" means "auto-negotiation";

Set duplex: The management duplex status of the port, including "auto", "full", and "half". "auto" means "auto-negotiation"; "full" means "full-duplex"; "half" means "half-duplex";

Act duplex: The actual duplex status of the port, including "auto", "full", and "half". "auto" means "auto-negotiation"; "full" means "full-duplex"; "half" means "half-duplex";

Set flow control: The management flow control of the port. "on" means to enable the port flow control; "off" means to disable the port flow control;

Act flow control: The actual flow control of the port. "on" means to enable the port flow control; "off" means to disable the port flow control. The default value is "off".

Mdix: The signal sending mode of the port. "normal" means that lines 1 and 2 are used for sending and line 3 and 6 are used for receiving; "cross" means that lines 1 and 2 are used for receiving and lines 3 and 6 are used for sending; "auto" means to select normal or cross automatically. The default value is auto.

Mtu: The MTU of the port. MTU is checked only when being input. The MTU is not checked when being output. If the length of the frame received by the port exceeds the set MTU, the frame is discarded. The unit is byte. It is required the configured value must be multiples of four bytes. Otherwise, it is cut down to the multiples of four. For example, the configured value is 1501 bytes, the system adjusts it to be 1500 bytes. The default value is 1728.

Link delay: The status delay time of the port. The default value is 0.

Pvid: The ID of the VLAN to which the port belongs. The default value is 1.

Edit: Click the  icon of one port and you can configure the port.

Basic Configuration	
Port	0/27
Description	<input type="text"/> (Up to 240 characters)
Status	<input checked="" type="radio"/> Open <input type="radio"/> Close
Speed	1000
Duplex	auto
Flow Control	<input type="radio"/> Open <input checked="" type="radio"/> Close
Mdix	normal
Mtu	1728 (64-10240,default is 1728)
Link Delay	0 (0-1,default is 0)
	<input type="button" value="set"/> <input type="button" value="recover"/> <input type="button" value="cancel"/>

Click **recover** to recover the port to the factory status.

 Note

It is required that the configured value must be the multiple of four bytes. For example, the configured value is 1501 bytes, and the system adjusts it to be 1500 bytes.

<input checked="" type="checkbox"/>	0/22	enabled	down	auto	unkown	auto	unkown	off	off	auto	1728	0
<input checked="" type="checkbox"/>	0/23	disabled	down	auto	unkown	auto	unkown	off	off	auto	1728	0
<input checked="" type="checkbox"/>	0/24	enabled	down	1000	unkown	auto	unkown	off	off	normal	1728	0
<input checked="" type="checkbox"/>	0/25	enabled	down	1000	unkown	auto	unkown	off	off	normal	1728	0
<input checked="" type="checkbox"/>	0/26	enabled	down	1000	unkown	auto	unkown	off	off	normal	1728	0
<input checked="" type="checkbox"/>	0/27	enabled	down	1000	unkown	auto	unkown	off	off	normal	1728	0

Basic Configuration

Port:

Description:
(Up to 240 characters)

Status: Open Close

Speed:

Duplex:

Flow Control: Open Close

Mdix:

Mtu: (64-10240,default is 1728)

Link Delay: (0-1,default is 0)

Tick the check box before the port number, click batch edit and you can edit the ports in batches.

Port Type Configuration

This section describes the configuration information about the port type.

<input type="checkbox"/> Port	Port Type	Community	Edit
<input type="checkbox"/> 0/0	uni	yes	
<input type="checkbox"/> 0/1	uni	no	
<input type="checkbox"/> 0/2	nni	yes	
<input type="checkbox"/> 0/3	uni	no	
<input type="checkbox"/> 0/4	uni	no	
<input type="checkbox"/> 0/5	uni	no	

Port: The numbers of all ports in the switch;

Port type: The UNI/NNI attribute of the port. Each physical port of the switch has UNI/NNI attribute. By default, all 10M/100M ports are set as UNI ports and the other ports are set as NNI ports. You can also modify the UNI/NNI attribute of each port via configuration.

Communication with other UNI port: By default, the UNI port is shutdown and the UNI ports cannot communicate with each other, but UNI and NNI ports can communicate with each other; NNI ports can also communicate with each other. You can make some UNI ports can

communicate with each other via configuration. “yes” means that the port can communicate with other UNI port; “no” means that the port cannot communicate with other UNI port.

Edit: Click the  icon of one port and you can configure the port.

<input type="checkbox"/>	0/17	disabled		disabled		disabled		none	
<input type="checkbox"/>	0/18	disabled		disabled		disabled		none	

Port: The numbers of all ports in the switch;

Unicast: The unknown unicast storm information of the port. "disabled" means that no unknown unicast storm information is configured; "bps" means to configure the storm control for bps (bits per second); "pps" means to configure the storm control for pps(packet per second). The default value is "disabled".

Threshold(kbps): The unknown unicast storm threshold of the port. The unit of pps is kpps and the value range is 0-2000000; the unit of bps is kbps, the granularity is 64kbps, and the value range is 64-8000000, that is, 64kbps to 8G.

Broadcast: The broadcast storm information of the port. "disabled" means that no broadcast storm information is configured; "bps" means to configure the storm control for bps (bits per second); "pps" means to configure the storm control for pps(packet per second). The default value is "disabled".

Threshold(kbps): The broadcast storm threshold of the port. The unit of pps is kpps and the value range is 0-2000000; the unit of bps is kbps, the granularity is 64kbps, and the value range is 64-8000000, that is, 64kbps to 8G.

Multicast: The unknown multicast storm information of the port; "disabled" means that no unknown multicast storm information is configured; "bps" means to configure the storm control for bps (bits per second); "pps" means to configure the storm control for pps(packet per second). The default value is "disabled".

Threshold(kbps): The unknown multicast storm threshold of the port. The unit of pps is kpps and the value range is 0-2000000; the unit of bps is kbps, the granularity is 64kbps, and the value range is 64-8000000, that is, 64kbps to 8G.

Action Over Threshold: The action executed after storm suppression. "shutdown" means to shut down the port; "trap" means to send TRAP alarms; "none" means no storm control action. The default value is "none".

Edit: Click the  icon of one port and you can configure the port.

Port Storm Control			
Port	0/27

Link Aggregation Configuration

This section describes the configuration information about the link aggregation.

<input type="checkbox"/> Link Aggregation	Mode	Load balance method	Number of ports in total	Number of ports attached	Root port	Member Port Numbers	Edit
<input type="checkbox"/> 2	manual	dst-ip	0	0			
<input type="checkbox"/> 3	manual	dst-ip	0	0			
<input type="checkbox"/> 4	manual	dst-ip	0	0			
<input type="checkbox"/> 5	manual	dst-ip	0	0			

add batch delete

Link Aggregation: The name of the link aggregation group;

Mode: The aggregation mode of the link aggregation. "manual" means the manual aggregation mode; "lacp" means the protocol aggregation mode.

Load balance method: The load balance algorithm of the link aggregation. "dst-ip" means the load balance algorithm based on destination IP address; "dst-mac" means the load balance algorithm based on destination MAC address; "src-dst-ip" means the load balance algorithm based on source and destination IP address; "src-dst-mac" means the load balance algorithm based on source and destination MAC address; "src-ip" means the load balance algorithm based on source IP address; "src-mac" means the load balance algorithm based on source MAC address; The default value is src-mac.

Number of ports in total: The total number of ports in the aggregation group;

Number of ports attached: The number of the ports that are aggregated in the aggregation group;

Root port: The root port of the aggregation group;

Member port numbers: The numbers of the member ports in the aggregation group;

Edit: Click the  icon of one aggregation group and you can configure the aggregation group. Click the  icon of one aggregation group and you can delete the aggregation group.

Click the  icon of one aggregation group to edit it.

Link Aggregation	<input type="text" value="2"/> (1-16)	Mode	<input type="text" value="manual"/>
Load balance method	<input type="text" value="dst-ip"/>	Lacp System Priority	<input type="text" value="32768"/> (1-65535,default is 32768)

batch delete: Click **batch delete** and you can delete the aggregation groups in batches.

Note

To delete the link aggregations in batches, you should first tick the check boxes before the aggregation groups. When the prompt box appears, click **Yes** to delete the selected records or click **Cancel** and the selected records are not deleted.

Port Monitoring Configuration

This section describes the configuration information about the port monitoring.

<input type="checkbox"/> Port	Enable Port Monitor	Enable Host Monitor	Host Limit	Current Host	Edit
<input type="checkbox"/> 0/4	Enabled	Enabled/IP	---	0	
<input type="checkbox"/> 0/5	Enabled	Enabled/IP	---	0	
<input type="checkbox"/> 0/10	Enabled	Disabled	---	0	
<input type="checkbox"/> 0/11	Enabled	Disabled	---	0	
<input type="checkbox"/> 0/12	Enabled	Disabled	---	0	
<input type="checkbox"/> 0/13	Enabled	Disabled	---	0	
<input type="checkbox"/> 0/14	Enabled	Enabled/IP	---	0	
<input type="checkbox"/> 0/15	Enabled	Enabled/IP	1111	0	
<input type="checkbox"/> 0/23	Enabled	Enabled/IP	1111	0	
<input type="checkbox"/> 0/24	Enabled	Enabled/IP	1111	0	

Port: The number of the port that is configured with port monitoring in the switch;

Enable port monitor: Whether to enable the port-level monitoring. "Enabled" means to enable the port-level monitoring; "Disabled" means to disable the port-level monitoring. The default value is Disabled;

Enable Host Monitor: Whether to enable host-level monitoring. "Enabled/IP" means to monitor by source IP; "Enabled/MAC" means to monitor by source MAC; "Disabled" means not to monitor. The default value is Disabled.

Host Limit: The maximum number of the hosts that are monitored;

Current Host: The number of the current hosts;

Edit: Click the icon of one port and you can configure the port. Click the icon of one port and you can delete the port.

Click the icon of one port to edit it.

Broadcast Packet (1-999999)

Forward Packet (1-999999)

Multicast Packet (1-999999)

Other Packet (1-999999)

Total Packet (1-999999)

Enable TCP connection restriction function

monitor protocol ether monitor or not (0x0000-0xffff)

monitor protocol ip monitor or not (0-255)

monitor protocol tcp-udp monitor or not (1-65535)

Note

After clicking the edit icon, you can set the parameters of the port monitoring. The host monitoring can be enabled only after the port monitoring is enabled and you should select **Monitor by source IP** or **Monitor by source MAC**. You can view the details by clicking the **detail** button of **monitor protocol ether**, **monitor protocol ip** and **monitor protocol tcp/udp**.

<input type="checkbox"/> Enable TCP connection restriction function			
monitor protocol ether	<input type="checkbox"/> monitor or not	<input type="text"/>	(0x0000-0xffff) detail
monitor protocol ip	<input type="checkbox"/> monitor or not	<input type="text"/>	(0-255) detail
monitor protocol tcp-udp	<input type="checkbox"/> monitor or not	<input type="text"/>	(1-65535) detail
		set cancel	
monitor protocol ether		monitor or not	
delete all			

monitor protocol ether	<input type="checkbox"/> monitor or not	<input type="text"/>	(0x0000-0xffff) detail
monitor protocol ip	<input type="checkbox"/> monitor or not	<input type="text"/>	(0-255) detail
monitor protocol tcp-udp	<input type="checkbox"/> monitor or not	<input type="text"/>	(1-65535) detail
		set cancel	
monitor protocol ip		monitor or not	
delete all			

monitor protocol ether	<input type="checkbox"/> monitor or not	<input type="text"/>	(0x0000-0xffff) detail
monitor protocol ip	<input type="checkbox"/> monitor or not	<input type="text"/>	(0-255) detail
monitor protocol tcp-udp	<input type="checkbox"/> monitor or not	<input type="text"/>	(1-65535) detail
		set cancel	
monitor protocol tcp-udp		monitor or not	
snmp-trap		on	
333		off	
delete all			

After clicking the **delete all** button of **monitor protocol ether**, **monitor protocol ip** and **monitor protocol tcp/udp**, a confirming box appears and click **Yes** to delete all information or click **Cancel**. After deleting, the result is as follows:

monitor protocol ether	<input type="checkbox"/> monitor or not	<input type="text"/>	(0x0000-0xffff) detail
monitor protocol ip	<input type="checkbox"/> monitor or not	<input type="text"/>	(0-255) detail
monitor protocol tcp-udp	<input type="checkbox"/> monitor or not	<input type="text"/>	(1-65535) detail
		set cancel	
monitor protocol ether		monitor or not	
delete all			

Add: Click **add** and you can perform the adding operation.

Blacklist Information

Port	Mac Address	Total Packet	Forward Packet	Broadcast Packet	Multicast Packet	Admin Packet	Other Packet
------	-------------	--------------	----------------	------------------	------------------	--------------	--------------

Port Packets: You can select administration packets, broadcast packets, forwarding packets, multicast packets, other packets or all packets from the **Stat Type** drop-down list. After selecting one, click **Search** and the details about the select packet type are displayed as follows.

Port Message				
Stat Type	Admin Packet	<input type="button" value="search"/>		
Port	Received Packets Number	Dropped Packets Number	Amount	DropAmount
0/4	0	0	0	0
0/5	0	0	0	0
0/10	0	0	0	0
0/11	0	0	0	0
0/12	0	0	0	0
0/13	0	0	0	0
0/14	0	0	0	0
0/15	0	0	0	0
0/23	0	0	0	0
0/24	0	0	0	0

Port: the number of the port on which the port monitoring is enabled;

Received Packets Number: the number of the packets received by the port;

Dropped Packet Number: the number of the packets dropped by the port;

Amount: The total number of the packets received by the port;

Drop Amount: The total number of the packets dropped by the port;

Port Host Information: the numbers of all physical ports in the switch. You can select administration packets, broadcast packets, forwarding packets, multicast packets, other packets or all packets from the drop-down list. After selecting one, click **Search** and the details about the select packet type are displayed as follows.

Port Host Information						
Port	port 0/17	Please choose	<input type="button" value="search"/>			
Mac Address	Blacklist or not	Limit	Received Packets Number	Dropped Packets Number	Amount	DropAmount

Mac Address: The MAC address of the host in each host;

Backlist or not: Whether the host is in the backlist;

Limit: The maximum limitation of the host;

Received Packets Number: the number of the packets received by the host;

Dropped Packet Number: the number of the packets dropped by the host;

Amount: The total number of the packets received by the host;

Drop Amount: The total number of the packets dropped by the host;

Backlist Information: Display the backlist to view the hosts that initiate the attack;

Port	Mac Address	Total Packet	Forward Packet	Broadcast Packet	Multicast Packet	Admin Packet	Other Packet

802.1X Authentication Configuration

This section describes the configuration information of the port 802.1X authentication.

Port	Enable 802.1X Configuration	Max User Number	Current User	EAPOL Packet Transmission	Uplink Port	Port Multicast Trigger	Guest Vlan	EAP Relay	Reauthperiod	Timeout Quiet Period
0/2	enable	256	0	enable	11	enable		enable	600	60
0/3	enable	256	0	disable		disable		disable	600	60
0/4	enable	256	0	enable		disable		disable	600	60
0/20	enable	256	0	enable		disable		disable	600	60
0/21	enable	256	0	disable		disable		disable	600	60
0/22	enable	256	0	disable		disable		disable	600	60
0/23	enable	256	0	disable		disable		disable	600	60
3	enable	256	0	enable		enable		enable	600	60

Port: The number of the port configured with 8021X authentication;

Enable 8021X Configuration: “enable” means to enable 8021X; “disable” means to disable 8021X. The default value is disable;

Max User Number: the maximum number of users of the port. The default value is 256;

Current user: The number of the current users of the port;

EAPOL packet transmission: the EAPOL packet transparent transmission function of the port; “enable” means to enable the EAPOL packet transparent transmission; “disable” means to disable the EAPOL packet transparent transmission. The default value is disable.

Uplink port: the uplink port during EAPOL packet transparent transmission;

Port multicast trigger: the function of triggering multicast on the port; “enable” means to enable the function of triggering multicast on the port; “disable” means to disable the function of triggering multicast on the port. The default value is disable.

Guest Vlan: the guest vlan of the port;

EAP relay: the EAP mode of the port, including EAP relay or EAP termination. “enable” means to enable the EAP relay mode; “disable”

means to disable the EAP relay mode (enable the EAP termination mode). The default value is disable;

Reauthperiod: the re-authentication time of the port (second). When the re-authentication is enabled on the port, the re-authentication is performed during the period. The default value is 600.

Timeout Quiet Period: the punishment time of the port (second). When the successive failed authentication times of one reaches the upper threshold, the user cannot perform authentication during the punishment time. The default value is 60.

Max Authentication Failure Times: the maximum authentication failure times of the port. When the authentication failure times of one user reaches the upper threshold, the user can re-authenticate only after a certain time. The default value is one.

Port Authentication Mode: the 802.1X authentication mode of the port, including port-based authentication mode or user-based authentication mode. "portbased" means the authentication mode based on the port; "macbased" means the authentication mode based on the user. The default value is macbased.

Edit: Click  of one port and you can edit the port.

802.1X Configuration	
Port	<input type="checkbox"/> 0/0 <input type="checkbox"/> 0/1 <input checked="" type="checkbox"/> 0/2 <input type="checkbox"/> 0/3 <input type="checkbox"/> 0/4 <input type="checkbox"/> 0/5 <input type="checkbox"/> 0/6 <input type="checkbox"/> 0/7 <input type="checkbox"/> 0/8 <input type="checkbox"/> 0/9 <input type="checkbox"/> 0/10 <input type="checkbox"/> 0/11 <input type="checkbox"/> 0/12 <input type="checkbox"/> 0/13 <input type="checkbox"/> 0/14 <input type="checkbox"/> 0/15 <input type="checkbox"/> 0/16 <input type="checkbox"/> 0/17 <input type="checkbox"/> 0/18 <input type="checkbox"/> 0/19 <input type="checkbox"/> 0/20 <input type="checkbox"/> 0/21 <input type="checkbox"/> 0/22 <input type="checkbox"/> 0/23 <input type="checkbox"/> 0/24 <input type="checkbox"/> 0/25 <input type="checkbox"/> 0/26 <input type="checkbox"/> 0/27 <input type="checkbox"/> 2 <input type="checkbox"/> 3 <input type="checkbox"/> 4 <input type="checkbox"/> 5
<input checked="" type="checkbox"/>	Enable 802.1X Authentication On Port
<input checked="" type="checkbox"/>	Enable EAPOL Packet Transmission Uplink Function
<input checked="" type="checkbox"/>	Eapol Relay Uplink Port: <input type="text" value="Link-aggregation 11"/>
<input checked="" type="checkbox"/>	Enable Port Multicast Trigger
	Port Multicast Trigger Period: <input type="text" value=""/> (5-3600,default is 15)
<input checked="" type="checkbox"/>	Enable Eap Relay
	Port Authentication Mode: <input type="text" value="PortAuthentication"/>
	Max User Number: <input type="text" value=""/> (1-4096,default is 256)
	Guest Vlan-ID: <input type="text" value=""/> (1-4094)
	Max Authfail: <input type="text" value="1"/> (1-10,default is 1)
<input checked="" type="checkbox"/>	Enable Reauthentication
	Timeout Reauthperiod: <input type="text" value="600"/> (1-3600,default is 600)
	Timeout Quiet Period: <input type="text" value="60"/> (1-65535,default is 60)
<input type="button" value="set"/> <input type="button" value="recover"/> <input type="button" value="cancel"/>	

 Note

For the port-based authentication mode, the maximum user number of the port does not take effect; for the user-based authentication mode, the configuration of guest vlan does not take effect.

Click **recover** to recover the port to the factory status.

Add: Click **add** and you can perform the adding operation.

Note

You can select multiple check boxes in the port list to perform batch operation.

IP Source Guard Configuration

This section describes the configuration information about IP Source Guard.

port	Enable IP Source Guard	filtrate	Edit
0/26	enable	IP+MAC	
0/27	enable	IP	
4	enable	IP	

add

Port: The number of the port configured with IP Source Guard (including aggregation port number);

Enable IP Source Guard: “enable” means to enable the IP Source Guard function one the port;

Filtrate: “IP+MAC” means to enable the IP Source Guard function by the IP+MAC filtering mode; “IP” means to enable the IP Source Guard function by the IP filtering mode;

Edit: Click of one port and you can edit the port.

port	Enable IP Source Guard	filtrate	Edit

Page1

Port: the number of the port configured with IP rule (including the aggregation port);

Action: the executed action of the rule. "permit" means that the executed action of the rule is permit; "deny" means that the executed action of the rule is deny.

Startip: The start IP address of the rule application;

endIp: The end IP address of the rule application;

Rule: The IP rule;

Edit: You can click of one port to delete it.

Note

One port can be bound for several times, so the interface adopts the paging function for users to view. The interface can be paged as desired by adjusting the text box before **change page size**. For example, the interface has three pieces of information. If the user inputs one and then clicks **change page size**, the interface is displayed by three pages. If the user does not input, but clicks **change page size** directly, the interface is paged by the default 20, as follows.

<input type="checkbox"/> port	action	startIp
<input type="checkbox"/> 0/2	permit	1.1.1.2
<input type="checkbox"/> 0/3	permit	123.123.123.123
<input type="checkbox"/> 0/4	permit	123.123.123.123
<input type="checkbox"/> 0/20	permit	1.1.1.2
<input type="checkbox"/> 0/20	permit	123.123.123.123
<input type="checkbox"/> 2	permit	123.123.123.123

Search Mac by Ip: Input IP address in the text box before the **search** button, click **search** and then you can find the corresponding MAC addresses;

Search Ip by Mac: Input MAC address in the text box before the **search** button, click **search** and then you can find the corresponding IP addresses;

Note

In the chapter, all physical ports in the port list are displayed in the form of 0/0, 0/1...0/27; the aggregation ports are displayed as 1, 2, 3...16.

VLAN Configuration

Overview

This chapter describes the VLAN configuration of MyPower S3400 series switch.

Port Mode

This section describes the configuration of the port mode.

Default VLAN (PVID) of Port

The packets without tag received by the port are divided to the default value. The default VLAN of the port is 1. The user can configure the default VLAN of the port as desired.

The default VLAN of the access port is the one to which it belongs, which cannot be configured.

Trunk port can Hybrid port can belong to several VLANs. The default VLAN can be configured.

Configure port mode				
Port	Port Mode	PVID	Packets Sent With Tag	Frame-type
port 0/0	access	1		untag
port 0/1	trunk	2	<input checked="" type="checkbox"/>	tag
port 0/2	access	1		all
port 0/3	access	1		tag
port 0/4	access	3		all

VLAN ID cannot be edited and the other parts are the same as the section of *Add VLAN*.

MAC-VLAN Configuration

Overview

This section describes the MAC-based VLAN configuration in the port VLAN.

Introduction to MAC-VLAN

MAC-based VLAN is to divide VLAN ID to the packet according to the source MAC address of the untag (without tag) packet received by the port.

Process the untag packets received by the port as follows:

- If the source MAC address of the packet is consistent with the MAC address of the VLAN that is distributed based on MAC, the packet is distributed to the VLAN ID of the MAC VLAN.
- If the packet does not match the MAC address set by MAC VLAN, the packet is distributed to the default VLAN ID of the port.

Configure MAC-VLAN		
<input type="checkbox"/>	MAC address	VLAN ID
<input type="checkbox"/>	0001.7a00.0004	3
<input type="checkbox"/>	0001.7a05.e91f	1
<input type="checkbox"/>	0022.153d.65ad	2

Add MAC-VLAN

Configure MAC-VLAN—Add MAC-VLAN			
MAC address	<input type="text"/>	VLAN ID	<input type="text"/>
			<input type="button" value="OK"/> <input type="button" value="Cancel"/>

IP Subnet VLAN Configuration

Overview

This section describes the IP subnet-based VLAN configuration in the port VLAN.

Introduction to IP Subnet VLAN

IP subnet-based VLAN is to divide VLAN ID to the packet according to the source IP address of the untag (without tag) packet received by the port.

Process the untag packets received by the port as follows:

- If the source IP address of the packet is in the segment of IP subnet-based VLAN, the packet is distributed to the VLAN ID of the segment.
- If the packet is not in the segment of IP subnet VLAN, the packet is distributed to the default VLAN ID of the port.

Configure IP-Subnet-VLAN			
<input type="checkbox"/>	IP address	Mask	VLAN ID
<input type="checkbox"/>	10.9.6.4	255.255.255.255	5
<input type="checkbox"/>	130.255.0.0	255.255.255.0	2

IP address	<input type="text"/>	Mask	<input type="text"/>
		VLAN ID	<input type="text"/>
			<input type="button" value="OK"/> <input type="button" value="Cancel"/>

Protocol VLAN Configuration

Overview

This section describes the protocol-based VLAN configuration in the port VLAN.

Introduction to Protocol VLAN

Protocol-based VLAN is to distribute VLAN ID to the packet according to the frame encapsulation format and protocol type of the untag packet (without tag) received by the port.

The protocol VLAN defines the protocol profile, which comprises the frame encapsulation and protocol type. One port can be configured with several protocol profiles. When the protocol VLAN is enabled on the port, the protocol profile is configured on the port.

The protocol VLAN processes the untag packet received by the port as follows:

- If the packet matches the protocol profile, the packet is distributed to the VLAN ID of the protocol profile configured on the port.
- If the packet does not match the protocol profile, the packet is distributed to the default VLAN ID of the port.

Configure Protocol-VLAN		Switch to configure protocol profile	
<input type="checkbox"/>	Port	Profile	VLAN ID
<input type="checkbox"/>	port 0/10	3	3
<input type="checkbox"/>	port 0/26	3	3
<input type="checkbox"/>	link-aggregation 2	3	3

Add Protocol VLAN

Click to enter the interface for adding new protocol VLAN.

Configure Protocol-VLAN--Add Protocol-VLAN			
<input type="text" value="port 0/0"/> <input type="text" value="port 0/1"/> <input type="text" value="port 0/2"/> <input type="text" value="port 0/3"/> <input type="text" value="port 0/4"/>	Profile	<input type="text" value="3"/>	VLAN ID <input type="text" value="6"/>
		<input type="button" value="Configure"/>	<input type="button" value="Cancel"/>

When configuring the protocol VLAN, multiple ports can be selected at the same time. **Profile** is the existing protocol profile number. If there is no protocol profile, configure the protocol profile first.

Configure Protocol Profile

Click [Switch to configure protocol profile](#) on the Configure Protocol-VLAN interface and you can configure the protocol profile.

Configure Protocol profile			Switch to configure Protocol-VLAN
<input type="checkbox"/>	Profile	Frame-type	Ether-type
<input type="checkbox"/>	1	ETHERII	0x1
<input type="checkbox"/>	3	SNAP	0x3
<input type="checkbox"/>	5	LLC	0x5

Add Protocol Profile

Click to enter into the interface for adding new protocol profile.

Configure Profile--to add profile					
Profile	<input type="text"/>	Frame-type	<input type="text" value="ETHERII"/>	Ether-type	<input type="text"/>
				<input type="button" value="OK"/>	<input type="button" value="Cancel"/>

Ether-type: The value range is 0x0001-0xffff.

Return to Interface for Configuring Protocol VLAN

Click [Switch to configure Protocol-VLAN](#) on the Configure Protocol Profile interface and you can return to the interface for configuring the protocol VLAN.

VLAN Function Division

Overview

This section describes the VLAN function division configuration of the port.

By default, the order of the priorities of the four VLANs from high to low is MAC-based VLAN, IP subnet-based VLAN, protocol-based VLAN, and port-based VLAN. On one port, the divided VLAN takes effect by the priority and only one divided VLAN can take effect.

Port	VLAN Divisions			Ip-Subnet-VLAN Priority Front
	MAC-VLAN	IP-Subnet-VLAN	Protocol-VLAN	
port 0/0	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
port 0/1	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
port 0/2	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
port 0/3	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
port 0/4	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

5 Change PageSize Page1 Auto-change page Configure Refresh

Ticking the check box means that the VLAN function is enabled on the port. Otherwise, disable the VLAN function.

Q-in-Q (Vlan dot1q tunnel) Configuration

This section describes the Vlan dot1q tunnel configuration.

Introduction to Vlan dot1q tunnel

Vlan dot1q tunnel is the expansion based on the 802.1Q protocol, that is, add another layer of 802.1Q tag (VLAN tag) to the original 802.1Q packet header. The two layers of tags make the number of VLANs become 4K×4K. QinQ encapsulates the VLAN Tag of the user's private network in the VLAN TAG of the public network so that the packet carries two layers of VLAN TAG to cross the backbone network (public network) of operators. In the public network, the packet is transmitted only according to the outer VLAN TAG (that is, VLAN TAG of the public network) and the VLAN TAG of the user's private network is screened, saving the VLAN IDs of the public network and providing a simple L2 VPN tunnel for users.

Vlan dot1q tunnel mapping is also the expansion based on 802.1Q. Different from Vlan dot1q tunnel, Vlan dot1q tunnel mapping is not to add one layer of 802.1Q tag to the original 802.1Q packet header, but replace the original 802.1Q tag with new 802.1Q tag. Therefore, the packet still carries only one layer of 802.1Q tag.

Basic Vlan dot1q tunnel Function

The Vlan dot1q tunnel function is enabled on the port. When the port receives one packet, it adds one layer of VLAN TAG to the packet. The

VLAN ID of the added Tag is the default VLAN ID of the port. If the received packet is the tag packet, it becomes the packet with two layers of Tag; if the received packet does not carry Tag, the packet becomes single-layer Tag packet.

Selective Vlan dot1q tunnel Function

The selective Vlan dot1q tunnel function cooperates with the port VLAN. The ports add specified outer VLAN Tag to the packet according to the selective Vlan dot1q tunnel (mapping) item and the VLAN ID in the packet tag. Vlan dot1q tunnel mapping is to replace the VLAN ID in the packet Tag with the specified VLAN ID. If the port does not match the selective Vlan dot1q tunnel (mapping) item, encapsulate the outer VLAN Tag for the packet. The VLAN Tag is the port PVID VLAN.

Q-IN-Q Configuration

Configure the items in the flexible vlan dot1q-tunnel(mapping) table of the port					
Port	Enable Basic Q-IN-Q	Dot1q-tunnel (mapping) Table	Vlan Dot1q-tunnel Drop	TPID	802.1p
port 0/10	<input type="checkbox"/>		<input type="checkbox"/>	<input type="text"/>	<input type="checkbox"/>
port 0/11	<input type="checkbox"/>	---	<input type="checkbox"/>	<input type="text"/>	<input type="checkbox"/>

2 Page6 Auto-change page

TPID (Tag Protocol Identifier): It is one tag field in the packet and indicates the protocol type of the VLAN Tag. The value of the VLAN Tag field is 0x8100. The default value of the outer VLAN Tag in the Vlan dot1q tunnel packet is 0x8100. Different manufacturers may set different outer VLAN Tags for the Vlan dot1q tunnel packet, such as 0x9100.

802.1p: Configure the value of the priority filed in the inner Tag of the port to be copied to the priority field in the outer Tag.

Note

It means not to configure TPID.

Mapping Configuration

Click the icon for configuring the mapping  to configure Q-IN-Q mapping on the port.

Vlan dot1q-tunnel(mapping) table of the port:port 0/10		
<input checked="" type="radio"/> Flexible Vlan Dot1q-tunnel <input type="radio"/> Flexible Vlan Dot1q-tunnel Mapping		
VLAN In Packet Tag	<input type="text"/>	VLAN of the new outer Tag <input type="text"/>
		<input type="button" value="Add"/> <input type="button" value="Cancel"/>
Flexible Vlan Dot1q-tunnel		
VLAN In Packet Tag	VLAN of the new outer Tag	Operation
1	2	<input type="button" value="X"/>
Flexible Vlan Dot1q-tunnel Mapping		
VLAN In Packet Tag	VLAN of the new outer Tag	Operation
5	4	<input type="button" value="X"/>

Note

When configuring new selective Vlan dot1q tunnel and if there are conflict items, the system automatically delete all conflict Vlan dot1q tunnel (mapping) items and then set new items.

L2 Protocol Control Configuration

This section describes the L2 protocol tunnel configuration.

Introduction to L2 protocol control

The L2 protocol control function is to control the L2 protocol packets received by the port. The L2 protocol control function can help to realize the following functions:

1. L2 protocol tunnel

It helps to transmit the L2 protocol packets such as BPDU and LACPDU of the customers' network transparently in the operators' network and realize the spanning tree calculation and link aggregation functions of the whole user network.

Enable the L2 protocol tunnel function on the port and the destination MAC address of the L2 protocol packet entering the port is replaced as the special multicast MAC address (by default, it is 01-00-0c-cd-cd-d0). The protocol packet is converted to the tunnel packet, which serves as the common L2 packet to be transmitted in the PVID VLAN of the port. When the tunnel packet is forwarded out from the port on which the L2 protocol tunnel function is enabled, the destination of the packet is recovered to the destination MAC address of the L2 protocol packet; the tunnel packet is replaced to common L2 packet to be sent out. The process of forwarding the tunnel packet out from the port on which the L2 protocol tunnel is not

enabled is the same as forwarding common L2 packet, complying with the forwarding principle in one VLAN. Enable the L2 protocol packet tunnel function on the two edge ports of the protocol tunnel to realize the tunnel function of the L2 protocol.

2. L2 protocol discard

It is to discard the L2 protocol packets such as BPDU and LACPDU received by the port directly so that the packets do not take part in the protocol processing.

3. L2 protocol peer

It is not to process the L2 protocol packets such as BPDU and LACPDU received by the port, but forward them to the upper protocol module to process. It is the default function.

Configure Special Multicast MAC for Replacing Destination MAC of L2 Protocol Packet

Configure special multicast MAC address	
MAC address	0100.0ccd.cdd0(default) <input type="button" value="Configure"/>

Note

The MAC address should be the one prompted in the command line and cannot be any other MAC address.

Caution

On the devices at the two sides of the L2 protocol tunnel, the configured special multicast MAC addresses for replacing the destination MAC addresses of the L2 protocol packets should be consistent.

L2 Protocol Control Configuration

L2 protocol control information		
Port	Protocol Of Packet	L2 Protocol Control
port 0/0	bmga	discard
port 0/1	dot1x	peer
port 0/2	gmrp	tunnel
port 0/3	gvrp	peer
port 0/4	lACP	peer
port 0/5	stp(mstp)	peer
port 0/6		
port 0/7		
port 0/8		
port 0/9		
port 0/10		

Select the port from the left port list (multiple ports can be selected at the same time) and then configure the L2 protocol control.

Caution

When the port on which the L2 protocol tunnel function is enabled receives the corresponding L2 protocol tunnel packets, the system shuts down the port temporarily.

ACL Configuration

The full name of ACL is Access Control List, which is called Access List for short. The configurations related with the ACL function in Maipu S34xx switch include Action Group configuration, Traffic Meter configuration, and Time Range configuration.

Main contents:

- Configure IP standard access list
- Configure IP extended access list
- Configure MAC standard access list
- Configure MAC extended access list
- Configure Time Range
- Configure Action Group
- Configure Traffic Meter
- Apply ACL to Object

Configure IP Standard Access List

On the interface, you can view and configure the IP access control list (IP-ACL). The IP-ACL comprises one or more filtering rules. It permits or deny the packets by matching the information in the packet and the parameters in the access list. The filtering of the access list is a process from up to down. That is, if one packet matches one rule, execute the operation (permit or deny) of the rule. Otherwise, the packet is processed by matching the next filtering rule. If the packet does not match any rule, it is processed according to the default rule.

ACL Configuration>IP-ACL Configure

IP Access List						
Name	Type	Rules	Remarks	Time Range	Action Group	Config
ACL_A	standard	1. permit From any address data package pass. Delete		--	--	+ ×
ACL_B	extended	1. permit using TCP protocol. From any address Go to any address data package pass. Delete	1. 描述信息 Delete	TIME_B/inactive Delete	--	+ ×

IP-ACL-Configure Bind Object Pages: 1 Page Size: Change PageSize

Add Rule

Click [+](#) to add one rule.

IP Access List Configure

ACL Name:

ACL Type:

ACL Remark: (max length 80 characters)

Action: (control rule adapt data package is permit or is deny pass)

Source Ip Address: (Pattern: 192.168.0.0 or 192.168.0.0/0.0.0.255, any means any address)

Bind Time-Range: [Create a new Time-Range?Go!](#)

Bind Action-Group: [Create a new Action-Group?Go!](#)

The operation brings in the name and type of the specified ACL, which cannot be changed.

Delete

Click [×](#) and you can delete one access list (if the access list is referenced, all configurations about the access list become invalid after the access list is deleted, but you can create an access list with the same name to recover).

Click [Delete](#) after one rule in the list and you can delete the rule (if the access list is bound to the interface, the system automatically deletes all bindings of the list on the interface after the list is deleted).

Create One IP Standard Access List

Click [IP-ACL Configure](#) to create one ACL.

Create one IP standard access list, which can be named by numbers or by the user.

If using numbers to name the list, the four kinds of access lists have fixed number ranges.

Access List Type	Number Range
IP standard access list	1-1000
IP extended access list	1001-2000
MAC standard access list	2001-3000
MAC extended access list	3001-4000

Bind Time Range

Select the existing time range to bind. You can also click **Create a new Time-Range** and then bind it.

Bind Action Group

Select the existing action group to bind. You can also click **Create a new Action-Group** and then bind it.

For the operations of creating action group and time range, refer to time range configuration or action group configuration.

Configure IP Extended Access List

IP extended control list is to make the classification rules according to IP protocol number, source IP address, destination IP address, source TCP/UDP, destination TCP/UDP port number, packet priority, TCP tag, and IP fragment tag, and process the packet. The contents defined by IP extended access list are richer, more exact and more flexible than the IP standard access list.

ACL Configuration>IP-ACL Configure						
IP Access List						
Name	Type	Rules	Remarks	Time Range	Action Group	Config
ACL_A	extended	1. deny using TCP protocol. From any address Go to any address data package pass. Delete		--	--	+ ×
ACL_B	extended	1. permit using TCP protocol. From any address Go to any address data package pass. Delete	1. 描述信息 Delete	TIME_B/inactive Delete	--	+ ×

IP-ACL Configure Bind Object Pages: 1 Page Size: Change PageSize

Create One Rule

Click **+** to create one rule.

IP Access List Configure	
ACL Name:	ACL_A
ACL Type:	Extended
ACL Remark:	(max length 80 characters)
Action:	Permit (control rule adapt data package is permit or is deny pass)
Protocol:	TCP (choose the adapted protocol)
Source Ip Address:	any (Pattern: 192.168.0.0 or 192.168.0.0/0.0.0.255, any means any address)
Source Port:	Any
Destination Ip Address:	any (Pattern: 192.168.0.0 or 192.168.0.0/0.0.0.255, any means any address)
Destination Port:	Any
TCP Sign:	--
DSCP:	(0-63) Precedence: -- Tos: (0-15)
Bind Time-Range:	Not binding Create a new Time-Range?Go!
Bind Action-Group:	Not binding Create a new Action-Group?Go!
OK Cancel	

The operation brings in the name and type of the specified ACL, which cannot be changed.

Delete

Click **×** and you can delete one access list (if the access list is referenced, all configurations about the access list become invalid after the access list is deleted, but you can create an access list with the same name to recover).

Click [Delete](#) after one rule in the list and you can delete the rule (if the access list is bound to the interface, the system automatically deletes all bindings of the list on the interface after the list is deleted).

Create One IP Extended Access List

Click  to create one ACL and select the type.

The ACL can be named by numbers or by the user. For naming by number, refer to the following table.

Access List Type	Number Range
IP standard access list	1-1000
IP extended access list	1001-2000
MAC standard access list	2001-3000
MAC extended access list	3001-4000

Protocol

Select the protocol to be matched. The system provides common protocols to select and you can also select the protocol number to specify the protocol.

DSCP

It is the differentiated services code point.

Bind Object

Click  to enter into the interface for binding object. For details, refer to the section of *Apply ACL to Object*.

Configure MAC Standard Access List

MAC standard access list is to make rules only according to the source MAC address of the Ethernet packet and process the packet.

MAC Access List						
Name	Type	Rules	Remarks	Time Range	Action Group	Configur
ACL_C	standard	1. deny From any address data package pass. Delete 2. permit From any address data package pass. Delete	1. message Delete	--	--	+ ×
ACL_D	standard	1. permit From any address data package pass. Delete	1. message Delete	--	--	+ ×
ACL_E	extended	1. permit From any address Go to any address data package pass. Delete	1. message Delete	--	--	+ ×

Pages: 1

Create One Rule

Click  to create one rule.

MAC Access List Configure	
ACL Name:	<input type="text" value="ACL_C"/>
ACL Type:	<input type="text" value="Standard"/>
ACL Remark:	<input type="text"/> (max length 80 characters)
Action:	<input type="text" value="Permit"/> (control rule adapt data package is permit or is deny pass)
Source Mac Address:	<input type="text" value="any"/> (Pattern: H.H.H.H.H.H/H.H.H, any means any address)
Bind Time Range:	<input type="text" value="Not binding"/> Create a new Time-Range?Go!
Bind Action Group:	<input type="text" value="Not binding"/> Create a new Action-Group?Go!
<input type="button" value="OK"/> <input type="button" value="Cancel"/>	

The operation brings in the name and type of the specified ACL, which cannot be changed.

Delete

Click  and you can delete one access list (if the access list is referenced, all configurations about the access list become invalid after the access list is deleted, but you can create an access list with the same name to recover).

Click [Delete](#) after one rule in the list and you can delete the rule (if the access list is bound to the interface, the system automatically deletes all bindings of the list on the interface after the list is deleted).

Create

Click  to create one MAC-ACL.

MAC Access List Configure	
ACL Name:	<input type="text"/>
ACL Type:	Standard <input type="button" value="v"/>
ACL Remark:	<input type="text"/> (max length 80 characters)
Action:	Permit <input type="button" value="v"/> (control rule adapt data package is permit or is deny pass)
Source Mac Address:	any <input type="text"/> (Pattern: H.H.H.H.H.H/H.H.H, any means any address)
Bind Time Range:	Not binding <input type="button" value="v"/> Create a new Time-Range?Go!
Bind Action Group:	Not binding <input type="button" value="v"/> Create a new Action-Group?Go!
<input type="button" value="OK"/> <input type="button" value="Cancel"/>	

Create one MAC standard access list, which can be named by numbers or by the user. For naming by number, refer to the IP-ACL section.

Bind Object

For binding time range and action group, refer to the IP-ACL section.

Configure MAC Extended Access List

MAC extended access list is to make rules according to source MAC address, destination MAC address, 802.1P priority, VLAN ID, and Ethernet type of the Ethernet packet, and process the packet.

ACL Configuration>MAC-ACL Configure

MAC Access List							
Name	Type	Rules	Remarks	Time Range	Action Group	Configure	
ACL_C	extended	1. deny From any address Go to any address data package pass. Delete		--	--	+ ×	
ACL_E	extended	1. permit From any address Go to any address data package pass. Delete	1. message Delete	--	--	+ ×

Bind Time Range: [Create a new Time-Range?Go!](#)

Bind Action Group: [Create a new Action-Group?Go!](#)

The operation brings in the name and type of the specified ACL, which cannot be changed.

Delete

Click [×](#) and you can delete one access list (if the access list is referenced, all configurations about the access list become invalid after the access list is deleted, but you can create an access list with the same name to recover).

Click [Delete](#) after one rule in the list and you can delete the rule (if the access list is bound to the interface, the system automatically deletes all bindings of the list on the interface after the list is deleted).

Create

Click to create one MAC extended access list and then select the type.

MAC Access List Configure

ACL Name:

ACL Type:

ACL Remark: (max length 80 characters)

Action: (control rule adapt data package is permit or is deny pass)

Source Mac Address: (Pattern: H.H.H.H.H.H/H.H.H, any means any address)

Destination Mac Address: (Pattern: H.H.H.H.H.H/H.H.H, any means any address)

Ether Type: Range: (0x0600-0xFFFF).

Precedence: (0-7)

VLAN-ID: (1-4094)

Bind Time Range: [Create a new Time-Range?Go!](#)

Bind Action Group: [Create a new Action-Group?Go!](#)

Create one MAC extended access list, which can be named by numbers or by the user. For naming by numbers, refer to the IP-ACL section.

Ethernet Type

The value range is 0x0600-0xFFFF.

The common types are:

- IP type: 0x0800
- ARP type: 0x0806

Precedence

The priority defined by IEEE802.1p and the value range is 0-7.

VLAN-ID

It is the VLAN number and the value range is 1-4094.

Configure Time Range

Time range is the time set. One time range includes 0-n time periods. The time range is the union set of the time periods. The **time-range** command is used to set the time range.

The status of the time range includes ACTIVE and INACTIVE. The status of the time range depends on the current status of the time periods in the time range. If any time period is in the ACTIVE state, the time range is in the ACTIVE state.

ACL Configuration>Time Range

Time Range List			
Name	Type	Rules	Config
TIME_A	active	1. Periodic:Weekdays 00:00 to 23:59 Delete 2. Periodic:Tuesday 00:00 to 23:59 Delete	+ ×
TIME_B	inactive	1. Absolute:Start 08:00 end 12:00 Delete 2. Absolute:Start January 23 08:00 end February 20 12:00 Delete	+ ×

Pages: 1 Page Size:

Create One Rule

Click [+](#) to create one time rule.

Time Range Configure

Name:

Type:

Periodic Time:

Start: (hh:mm) -- End: (hh:mm)

The operation brings in the name of the specified time range, which cannot be changed.

Delete

Click [×](#) and you can delete one time range (if the time range is referenced, all configurations about the time range become invalid after the time range is deleted, but you can create a time range with the same name to recover).

Click [Delete](#) after one time rule to delete the time rule.

Create

Click to create one time range. The time range includes two kinds:

Periodic time range: It is required to configure one day or several days of each week, and the start time and the end time.

The name of the time range cannot begin with numbers and cannot exceed 31 characters.

Absolute time range: It is required to configure the year, month, day, hour and minute of the start time and end time.

Configure Action Group

Action group is the action set. One action group can include packet mirroring, packet re-direction, packet modification, packet flow control, packet counting action.

ACL Configuration > Action Group Configure

Action Group List								
Name	Counter	Meter	Mirror Port	Redirect Port	L2 Remark	L3 Remark	Config	
ACTION_A	All-Colors	METER_A/active	0/15	0/15	dot1p:2	dscp:55

Apply ACL to Object

After setting up one access list, it can be applied on one or more objects, so as to realize the function of filtering ACL packets. In Maipu S34xx switch, the access list can only be applied at the input direction of the object. The objects include port object, global object, and VLAN object.

ACL Configuration>ACL Binding

Binding List				
Binding Object	Acl Name	Acl Type	Acl State	Configure
vlan:3	ACL_A	Extended: IP-ACL	valid	✕
port:0/23	ACL_B	Extended: IP-ACL	valid	✕
port:0/20	ACL_C	Extended: MAC-ACL	valid	✕
port:0/26	ACL_E	Extended: MAC-ACL	valid	✕

Pages: 1 Page Size:

Delete

Click [✕](#) and you can delete the binding relation between the binding object and ACL (deleting the binding time domain and action group is performed on the corresponding ACL interface).

Apply

Click **New Binding** to apply ACL to object.

ACL:	<input type="text" value="not binding"/>	(Choose configured ACL to binding.'ip-', 'mac-' mark ACL type)
Time Range:	<input type="text" value="not binding"/>	(Choose configured Time-range to binding.)Create a new Time-Range? Go!
Action Group:	<input type="text" value="not binding"/>	(Choose configured Action-group to binding.) Create a new Action-Group? Go!
Port:	<input type="text" value="not binding"/>	Direction: <input type="text" value="in"/> mp3400 only support Inbound packets

Global:	<input type="text" value="not binding"/>	Direction: <input type="text" value="in"/> mp3400 only support Inbound packets

Ip-acl can be applied to all objects.

ACL:	<input type="text" value="ip-ACL_A"/>	(Choose configured ACL to binding.'ip-', 'mac-' mark ACL type)
Time Range:	<input type="text" value="not binding"/>	(Choose configured Time-range to binding.)Create a new Time-Range? Go!
Action Group:	<input type="text" value="not binding"/>	(Choose configured Action-group to binding.) Create a new Action-Group? Go!
Port:	<input type="text" value="not binding"/>	Direction: <input type="text" value="in"/> mp3400 only support Inbound packets
VLAN:	<input type="text" value="not binding"/>	Direction: <input type="text" value="in"/> mp3400 only support Inbound packets
Global:	<input type="text" value="not binding"/>	Direction: <input type="text" value="in"/> mp3400 only support Inbound packets

Mac-acl cannot be applied to VLAN or global.

ACL:	<input type="text" value="mac-ACL_C"/>	(Choose configured ACL to binding.'ip-', 'mac-' mark ACL type)
Time Range:	<input type="text" value="not binding"/>	(Choose configured Time-range to binding.)Create a new Time-Range? Go!
Action Group:	<input type="text" value="not binding"/>	(Choose configured Action-group to binding.) Create a new Action-Group? Go!
Port:	<input type="text" value="not binding"/>	Direction: <input type="text" value="in"/> mp3400 only support Inbound packets
VLAN:	<input type="text" value="not binding"/>	Direction: <input type="text" value="in"/> mp3400 only support Inbound packets
Global:	<input type="text" value="not binding"/>	Direction: <input type="text" value="in"/> mp3400 only support Inbound packets

 **Note**

Viewing and deleting the time range and action group bound to ACL are performed on the interface of the bound ACL.

S3400 switch only supports the ACL at the in direction, so the direction is grayed and unavailable.

QoS Configuration

This chapter describes the QoS usage and configuration of the port.

Main contents:

- Priority mapping
- Queue scheduling mode
- Dropping mode
- Speed limitation
- Port flow shaping
- Port queue flow shaping

Priority Mapping

The priority mapping is to map to the local priority according to the dscp or 802.1p value of the packet. And then the local priority maps to the corresponding drop priority. The priority mapping is to configure the relation of these mappings.

The mapping relation is as follows:

1. dscp-lp mapping: Map to the local priority IP value according to the DSCP value of the packet;
2. dot1p-lp mapping: Map to the local priority IP according to the 802.1p priority of the packet;
3. lp-dp mapping: Map to the drop priority according to the local priority. The smaller the drop priority, the earlier the packet is dropped. The drop priority corresponds to the queue on the port. The packet with dp as 0 is input to queue 0; the packet with dp as 1 is input to queue 1...;
4. dscp-dscp mapping: Modify the dscp value of the packet according to the dscp of the packet;

QoS Configuration > Priority Mapping

Port	dscp-dscp	dot1p-lp	dscp-lp	lp-dp	Configure

Queue Scheduling Mode

Each port has eight output queues. The following scheduling policies can be adopted:

SP (Strict Priority): Queue 7 has the highest priority and queue 0 has the lowest priority;

RR (Round Robin): Packet-based fair scheduling. As long as one queue schedules one packet, turn to the next queue;

WRR (Weighted Round Robin): Packet-based weighted scheduling. You can configure how many packets are scheduled by each queue before turning to the next queue. When it is configured as 0, it indicates strict priority queue;

WDRR (Weighted Deficit Round Robin): It is an improvement for the WRR algorithm.

Drop Mode

The port supports two drop modes, including Tail Drop and sRED. sRED is a simple random early drop algorithm, which begins to drop a color of packets before the queue is full. It has two queue thresholds, including low threshold and high threshold. Every time one packet to enter the queue is received, check the current queue depth. If the queue depth is lower than the low threshold, the packet enters the queue; if the queue depth is higher than the high threshold, the packet is dropped. If the queue depth is between the low threshold and the high threshold, whether the packet is dropped depends on the configured drop rate.

Rate Limitation

To ensure that the information flow over the network does not overload and cause blocking. Maipu series switches provide port-based speed limitation at the input direction, that is, limit the total speed at the receiving direction of the port and the overloading flow is dropped. The configured parameters are bandwidth threshold (Kbit, 64K is the minimum granularity and the burst flow (bytes).

Port Flow Shaping

Port-based flow shaping at the output direction makes packets be sent out with even speed. The configured parameters are bandwidth threshold (Kbit, 64K is the minimum granularity and the burst flow (bytes). The burst flow step length is 4K bytes.

Configure the flow shaping. The input parameters may be inconsistent with the actual configured values, because the driver adjusts the input value according to the chip. The last value of rate is an integer multiple of 64. When the input value is not the integer multiple of 64, the driver adjusts it to the minimum integer multiple of 64, which is larger than the current value. The value of burst-size after modification is an integer multiple of 4096.

When the port has no flow shaping, it is displayed as --.

Edit

Edit Single Flow Shaping

Click to configure the flow shaping of the port.

Port Shaping Configure

Port: (Pattern:'0/0'or'0/0-0/10'or'0/0,0/1,0/2...')

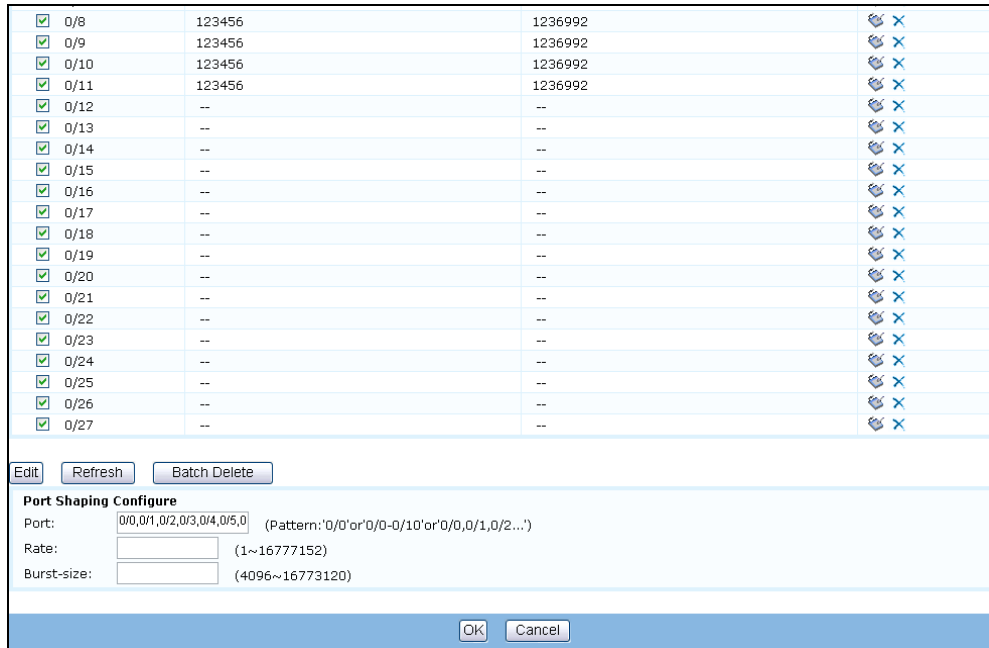

Rate: (1~16777152)

Burst-size: (4096~16773120)

On the interface, there is the select port and the related values. The port cannot be modified.

Batch Edit

Click to edit the flow shaping of all selected ports.

On the interface, there are only the selected ports. You can also input the desired ports according to the port format.

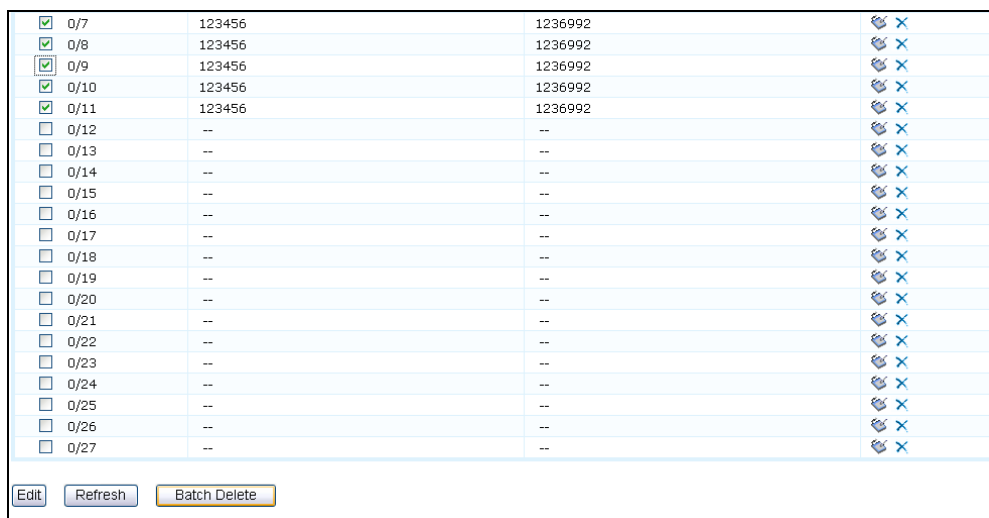

Delete

Delete Single Flow Shaping

Click to delete the flows shaping of the corresponding port.

Batch Delete

Click to delete the flow shaping of all selected ports.

Port Queue Flow Shaping

Port-based flow shaping at the output direction makes packets be sent out with even speed. The configured parameters are queue number, committed information rate, committed burst size, peak burst size, and peak information rate.

Configure the flow shaping for the queue on the port. The value range of the queue number is 0-7. The later four parameters are committed information rate (CIR), committed burst size (CBS), peak burst size (PBS), and peak information rate (PIR). Here, PIR, CIR and step length are all 64. If the input value is not the multiple of 64, the diver automatically adjusts it. The values of CBS and PBS are an integer multiple of 4096. The calculation method is consistent with the **burst-size** command.

The queue number and the corresponding flow shaping are deleted, but the port is not deleted. If there is no queue flow shaping on the port, it is displayed as --.

OAM Configuration

CFM Configuration

Overview

The IEEE 802.1ag protocol calls Ethernet OAM function as Connectivity Fault Management (CFM). It is service-based end-to-end Ethernet OAM function.

The carrier-class Ethernet needs to provide different management scope and contents for different organizations. Usually, there are three kinds of organizations that refer to carrier-class Ethernet services, including users, service providers, and network carriers. Users purchase Ethernet services from service providers; service providers can use their own network or other carriers' network to provide end-to-end Ethernet services. In IEEE 802.1ag, carrier-class Ethernet is divided to one multi-domain OAM network model, including three maintenance grades, that is, users, service providers, and carriers. They correspond to different management domains. The service providers are responsible for end-to-end service management and the carriers provide service transmission.

Maintenance Domain (MD): It is a part of the network covered by the connectivity fault management. Its limit is defined by a series of maintenance points (MP) configured on the ports. The maintenance domain name is used to identify the MD. According to multi-domain OAM network model of 802.1ag, MD has hierarchical levels. The high level can include the low level, but cannot intersect, that is, the range covered by high level is larger than that covered by the low level. The integers of 0-7 are used to identify different levels. The higher the level, the bigger the number.

Maintenance Association (MA): It is a set in MD and includes some MPs. MA is identified by MD name + short MA name. MA serves one VLAN, in which the packets sent by the MPs in MA are forwarded and the packets sent by other MPs in the MA are received at the same time. Therefore, MA is also called Service Instance (SI).

Maintenance point: It is one Maintenance Association End Point (MEP) or Maintenance Association Intermediate Point (MIP). It is configured on the port and belongs to one MA. On one port, each MA can be configured with only one MP.

Maintenance Association End Point (MEP): It can receive and send any CFM packet. Each MEP is identified by an integer, which is called MEP ID. MEP is configured on the port and decides the MD range. The MA and MD to which the MEP belongs decide the VLAN attribute and level attribute of the packet sent by MEP. According to the location of MEP in MA, the MEP direction includes inward and outward. If the packet in MA is received from the port on which the MEP is configured, the MEP direction is outward. Similarly, the outward MEP can only send packets to the network via the port on which the MEP is configured. Contrariwise, if the packet in MA is received from other port, the MEP direction is inward. The inward MEP cannot send packets to the network via the port on which the MEP is configured.

Maintenance Association Intermediate Point (MIP): It can process and respond to some CFM packets (such as LT packet or the packet whose destination is the LB which is at the same layer as itself), but cannot send packets initiatively. The MA and MD to which the MIP belongs decide the VLAN attribute and the MD level of the received packet.

CEM has the following functions:

- The function of checking connectivity;
- The function of checking loopback;
- The function of tracking link;

Maintenance Domain Configuration

Add Maintenance Domain

Click  to enter into the interface for adding the maintenance domain.

Domain Name: length: <1~21 characters>
 Level:
 Direction: Inward Outward

Add Service Instance of Maintenance Domain

The initial interface of the maintenance domain is as follows:

Domain Name:	domain1
Level:	0
Direction:	Outward

Direction: Inward Outward

Click to enter into the interface for configuring the service instance.

ServiceID length: <1~22 characters>
 VLAN ID:
 cc-interval (seconds):

Click to cancel adding the service instance of the maintenance domain.

The basic information of the service instance:

ServiceID	service1
VLAN ID:	1
Crosscheck:	Enable
cc-interval (seconds):	10
RDI:	Enable
Local-MEP:	1
Remote-MEP:	0
Crosscheck-MEP:	1

cc-interval(seconds):

Click to set the interval of MEP sending CCM packets; click to delete the service instance.

Local Maintenance End Point

MEP ID	Level	Type	VLAN ID	Port	cc	MAC	Delete
2	0	MEP	1	port 0/1	Enable <input type="button" value="Disable"/>	0001.7A4F.4970	<input type="button" value="X"/>

Port: MEP ID: cc

Click to disable the function of MEP sending CCM packets; click to delete the MEP.

Click to set the MEP on the port.

Remote Maintenance End Point

Remote Target	MEP ID	Level	VLAN ID	MAC	Port Status	IngressPort	Age(seconds)	Expire(seconds)
<input type="button" value="Refresh"/> <input type="button" value="Clear"/>								
Test Action: <input checked="" type="radio"/> ping <input type="radio"/> traceroute								
Test MAC: <input type="text" value="0001.7A84.4F6D"/> (eg:0001.7A84.4F6D)								
<input type="button" value="Execute"/> <input type="button" value="Clear Traceroute Cache"/>								
Test Result:								
<pre> Pinging 0001.7A84.4F6D with 64 bytes of data: Ping statistics for 0001.7A84.4F6D : Packets: Sent = 4, Received = 0, Lost = 4 (100% loss) </pre>								

Action:

- Ping: loopback test;
- Traceroute: link tracking test;

Connectivity Checking Maintenance End Point

MEP ID	Level	VLAN ID	Remote MAC	MEP Status	Delete
1	0	1	0000.0000.0000	Down	<input type="button" value="X"/>
2	0	1	0000.0000.0000	Down	<input type="button" value="X"/>

Remote MEP ID: range:<1-8191>

Click to add remote MEP; click to delete the remote MEP.

CFM Port Configuration

Port OAM Event log Configuration (Please choose the port from the foregoing list)

Port:

Event Log Status: Enable Disable

Cache Size: (0-65535,default 50)

Port: the number of the port on which the OAM event log is to be configured;

Event Log Status: "Enable" means to enable the event log information; "Disable" means to disable the event log information; by default, the event log information is enabled;

Cache Size: the maximum number of the cached event log information of the Ethernet OAM; the default value is 50;

Event Log Detail: When the port is configured with the maximum cache size, there is the link of the details. Click **Detail** to display the detailed information as follows. Click **Close** to hide the information.

Set: Select port number, event log status, and cache size, and then click **Set** as follows.

<input checked="" type="checkbox"/>	port 0/23	Enable	600	details
<input checked="" type="checkbox"/>	port 0/24	Enable	600	details
<input checked="" type="checkbox"/>	port 0/25	Enable	600	details
<input checked="" type="checkbox"/>	port 0/26	Enable	600	details
<input checked="" type="checkbox"/>	port 0/27	Enable	600	details

Port OAM Event log Configuration (Please choose the port from the foregoing list)

Port

Event Log Status Enable Disable

Cache Size (0-65535, default)

After setting successfully, the following figure is displayed.

<input type="checkbox"/>	port 0/23	Enable	600	details
<input type="checkbox"/>	port 0/24	Enable	600	details
<input type="checkbox"/>	port 0/25	Enable	600	details
<input type="checkbox"/>	port 0/26	Enable	600	details
<input type="checkbox"/>	port 0/27	Enable	600	details

Note

After enabling the OAM event log of the port, the event log status in the list is displayed in the bold black form. Otherwise, it is not in bold form.

Port OAM Detection Packet Configuration

The following is the interface for configuring the OAM detection packet.

Port OAM Detection Packets Configuration				
<input type="checkbox"/>	Port	OAM Mode	Hello Rate	Hello Timeout
<input type="checkbox"/>	port 0/0	Active	1000	5000
<input type="checkbox"/>	port 0/1	Active	1000	5000
<input type="checkbox"/>	port 0/2	Active	1000	5000
<input type="checkbox"/>	port 0/3	Active	1000	5000
<input type="checkbox"/>	port 0/4	Active	1000	5000
<input type="checkbox"/>	port 0/5	Active	1000	5000

<input type="checkbox"/>	port 0/27	Passive	3333	7777

Port OAM Detecting Packet Configuration(Please choose the port from the foregoing list)

Port	port 0/24, port 0/25, port 0/26, port 0/27		
OAM Mode	<input checked="" type="radio"/> Active	<input type="radio"/> Passive	
Hello Rate	<input type="text" value="1000"/>	(100~65535,default 1000 milliseconds)	
Hello Timeout	<input type="text" value="5000"/>	(100~65535,default 5000 milliseconds)	

Port: the number of the port on which the OAM detection packet is configured;

OAM Mode: It is the Ethernet OAM mode. "Active" means the Ethernet OAM mode is active; "Passive" means the Ethernet OAM mode is passive. The default value is active.

Hello rate: It is the interval for sending hello packets (that is information OAMPDU) of Ethernet OAM. The default value is 1000.

Hello Timeout: It is the timeout of the Ethernet OAM connection. The default value is 5000;

Set: Select the port number, OAM mode, Hello rate, and Hello timeout, and then click **Set** as follows.

<input checked="" type="checkbox"/>	port 0/24	Passive	2222	6666
<input checked="" type="checkbox"/>	port 0/25	Passive	2222	6666
<input checked="" type="checkbox"/>	port 0/26	Passive	2222	6666
<input checked="" type="checkbox"/>	port 0/27	Passive	2222	6666

Port OAM Detecting Packet Configuration(Please choose the port from the foregoing list)

Hello Rate	<input type="text" value="3333"/>	(100~65535,default 1000 milliseconds)	
Hello Timeout	<input type="text" value="7777"/>	(100~65535,default 5000 milliseconds)	

After setting successfully, the following interface is displayed.

<input type="checkbox"/>	port 0/24	Passive	3333	7777
<input type="checkbox"/>	port 0/25	Passive	3333	7777
<input type="checkbox"/>	port 0/26	Passive	3333	7777
<input type="checkbox"/>	port 0/27	Passive	3333	7777

Refresh: Perform the refreshing operation on the interface.

Port OAM Link Monitoring Configuration

The following is the interface for configuring OAM link monitoring on the port.

Port OAM Link Monitoring Configuration													
<input type="checkbox"/>	Port	Link Monitor Status	Monitor Error Symbol			Monitor Error Frame			Monitor Error Frame Period			Monitor Error Fra	
			Window (seconds)	High Threshold Value And Action	Low Threshold Value And Action	Window (seconds)	High Threshold Value And Action	Low Threshold Value And Action	Window (seconds)	High Threshold Value And Action	Low Threshold Value And Action	Window (seconds)	High Threshold Value An
<input type="checkbox"/>	port 0/0	Enable	1	No Monitor	1 : None	1	No Monitor	1 : None	1000	No Monitor	1 : None	60	No Monitor
<input type="checkbox"/>	port 0/1	Enable	1	No Monitor	1 : None	1	No Monitor	1 : None	1000	No Monitor	1 : None	60	No Monitor
<input type="checkbox"/>	port 0/2	Enable	1	No Monitor	1 : None	1	No Monitor	1 : None	1000	No Monitor	1 : None	60	No Monitor
<input type="checkbox"/>	port 0/3	Enable	1	No Monitor	1 : None	1	No Monitor	1 : None	1000	No Monitor	1 : None	60	No Monitor
<input type="checkbox"/>	port 0/4	Enable	1	No Monitor	1 : None	1	No Monitor	1 : None	1000	No Monitor	1 : None	60	No Monitor
<input type="checkbox"/>	port 0/5	Enable	1	No Monitor	1 : None	1	No Monitor	1 : None	1000	No Monitor	1 : None	60	No Monitor

Port: the number of the port on which the OAM link monitoring is to be configured;

Link monitor status: the link monitoring function of Ethernet OAM; "Enable" means to enable the link monitoring function of Ethernet OAM; "Disable" means to disable the link monitoring function of Ethernet OAM; by default, the link monitoring function of Ethernet OAM is enabled;

Window (seconds) of monitor error symbol: the window period of the error signal detection of the OAM link monitoring; the default value is 1s;

High threshold value and action: the upper threshold of the error signal detection of Ethernet OAM link monitoring and the error response processing for the upper threshold of the error signal detection of Ethernet OAM link monitoring; by default, the upper threshold is no monitor;

Low threshold value and action: the low threshold of the error signal detection of Ethernet OAM link monitoring and the error response processing for the low threshold of the error signal detection of Ethernet OAM link monitoring; by default, the low threshold is 1;

Window (seconds) of monitor error frame: the window period of the error frame detection of Ethernet OAM link monitoring; the default value is 1 second;

High threshold value and action: the upper threshold of the error frame detection of Ethernet OAM link monitoring and the error response processing for the upper threshold of the error frame detection of Ethernet OAM link monitoring; the default upper threshold value is no monitor;

Low threshold value and action: the low threshold of the error frame detection of Ethernet OAM link monitoring and the error response processing for the low threshold of the error frame detection of Ethernet OAM link monitoring; the default low threshold is 1;

Window (seconds) of monitor error frame period: the window period of the error frame periodical detection of Ethernet OAM link monitoring; the default value is 1000 frames;

High threshold value and action: the upper threshold of the error frame periodical detection of Ethernet OAM link monitoring and the error response processing for the upper threshold of the error frame periodical detection of Ethernet OAM link monitoring; the default upper threshold value is no monitor;

Low threshold value and action: the low threshold of the error frame periodical detection of Ethernet OAM link monitoring and the error response processing for the low threshold of the error frame periodical detection of Ethernet OAM link monitoring; the default low threshold is 1;

Window (seconds) of monitor error frame seconds: the window period of the error frame seconds detection of Ethernet OAM link monitoring; the default value is 60s.

High threshold value and action: the upper threshold of the error frame seconds detection of Ethernet OAM link monitoring and the error response processing for the upper threshold of the error frame seconds detection of Ethernet OAM link monitoring; the default upper threshold value is no monitor;

Low threshold value and action: the low threshold of the error frame seconds detection of Ethernet OAM link monitoring and the error response processing for the low threshold of the error frame seconds detection of Ethernet OAM link monitoring; the default low threshold is 1;

The setting list includes Link Monitor Status, Monitor Error Symbol, Monitor Error Frame, Monitor Error Frame Period, and Monitor Error Frame Seconds.

The setting of link monitoring status is as follows:

<input checked="" type="checkbox"/> port 0/26	Enable	20	333 : Error-Disable-Interface	111 : Error-Disable-Interface	30	6666 : Error-Disable-Interface	5555 : Error-Disable-Interface	5000	8888 : Error-Disable-Interface	7777 : Error-Disable-Interface	80
<input checked="" type="checkbox"/> port 0/27	Enable	20	333 : Error-Disable-Interface	111 : Error-Disable-Interface	30	6666 : Error-Disable-Interface	5555 : Error-Disable-Interface	5000	8888 : Error-Disable-Interface	7777 : Error-Disable-Interface	80

Port OAM Link Monitoring Configuration(Please choose the port from the foregoing list)

Port

Link Monitor Status Enable Disable

The selected port numbers are automatically added to the port list. After successful setting, the following interface is shown.

<input type="checkbox"/> port 0/26	Enable	20	333 : Error-Disable-Interface	111 : Error-Disable-Interface	30
<input type="checkbox"/> port 0/27	Enable	20	333 : Error-Disable-Interface	111 : Error-Disable-Interface	30

 Note

After enabling OAM link monitoring configuration on the port, the link monitoring status in the list is displayed in bold and black form. Otherwise, it is displayed not in bold form.

The setting of the error signal detection is as follows:

<input checked="" type="checkbox"/>	port 0/26	Enable	20	333 : Error-Disable-Interface	111 : Error-Disable-Interface	30	6666 : Error-Disable-Interface	5555 : Error-Disable-Interface	5000	8888 : Error-Disable-Interface	7777 : Error-Disable-Interface	800

<input type="checkbox"/> port 0/10	Enable
<input type="checkbox"/> port 0/11	Enable

Configure remote loopback of port (Please choose the port from the foregoing list)

Port

Remote Loopback Enable Disable

Execute Remote Loopback

Port

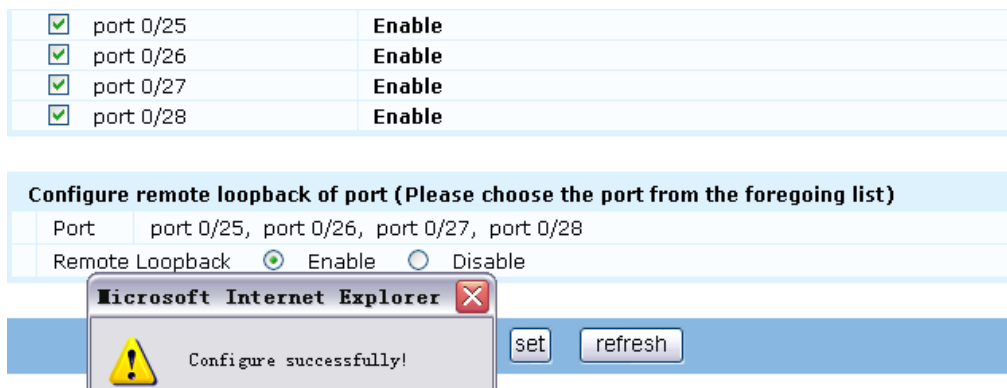

Loopback Test Time Range <1~600>Seconds

Test Time		The size of the sent packet	
The number of sent packets		The number of received packets	
The number of lost packets		The number of error packets	
Average Delay		Connection Speed	

Port: the number of the port to be configured with OAM remote loopback test;

Remote Loopback: The remote loopback function of Ethernet OAM; **“Enable”** means that the remote loopback function of Ethernet OAM is not disabled; **“Disable”** means that the remote loopback function of Ethernet OAM is disabled; the default value is **“Enable”**.

The setting is as follows:

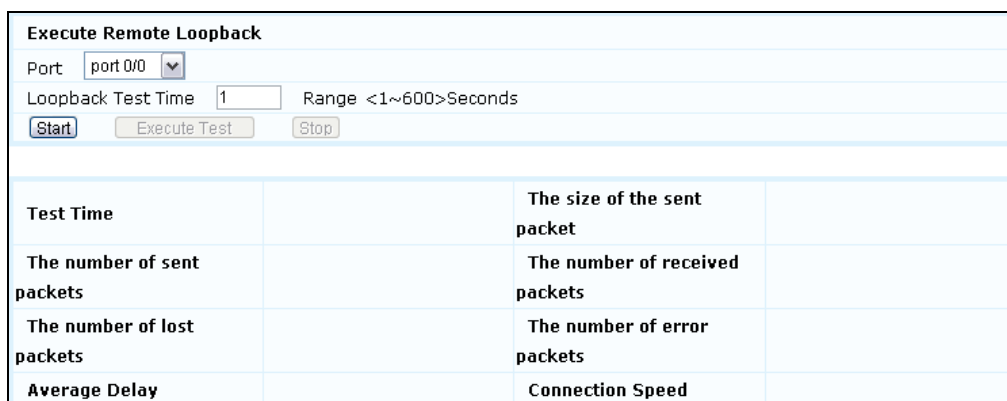

After setting successfully, the following interface is shown.

<input type="checkbox"/>	port 0/25	Disable
<input type="checkbox"/>	port 0/26	Disable
<input type="checkbox"/>	port 0/27	Disable

Note

After enabling the OAM remote loopback test function on the port, the remote loopback function in the list is displayed in black and bold form. Otherwise, it is displayed not in bold form.

Refresh: to refresh the interface;

Port: the number of the port to send the remote loopback command;

Loopback Test Time: the time of the remote loopback test; the unit is second;

Start: to send the command of enabling remote loopback test to the peer end;

Execute Test: After enabling the remote loopback command, click **Execute Test**, and then the tested data is displayed on the interface;

Stop: to send the command of disabling remote loopback test to the peer end;

ELMI Configuration

E-LMI (Ethernet local management interface) is put forward by MEF and the serial No. is MEF16. Metro-E forum defines a group of extending service attributes and related parameters used to provide the Ethernet services from UNI to UNI. The E-LMI protocol can get and transmit the sufficient EVC and UNI status information, and UNI and EVC configuration information from the PE device to the CE device, so as to complete the configuration of the CE device.

<input type="checkbox"/> Port	Port E-LMI	N391(times)	N393(times)	T391(seconds)	T392(seconds)

E-LMI Protocol Configuration on CE

Refer to the above section.

EVC-UNI Configuration

Configure the UNI type of the local port. Currently, there are three types, including bundling, all-to-one, and multiplexing.

Bundling: One UNI port can be bound to several EVCs, and one or several CEVLANS are mapped to the EVCs;

all-to-one: One UNI port is bound to only one EVC and all CEVLANS are mapped to the EVC;

multiplexing: One UNI port can be bound to several EVCs and only one CEVLAN is mapped to the EVCs.

EVC Information

EVC is put forward by MEF. It is the virtual connection to connect two or more UNIs and switch Ethernet service frames between them. EVC can be divided to three types according to the connection mode.

- Point-to-point EVC (called Eline Service), including two types:

EPL: Ethernet private line

EVPL: Ethernet virtual private line

The difference is that there can be several EVPLs on one UNI, while there can be only one EPL on one UNI. Currently, for RL08 QinQ, there is no difference and they both adopt one technology to realize. There is some difference only on the configuration.

- Multipoint-to-multipoint EVC (called ELAN Service)
- Point-to-multipoint EVC: It is one special EVC. One end is called root and the other end is called leaf. The EVC comprises one or more roots (usually, it is one) + one or more leaves. The frames from the root node to the leaf node need to be copied to all leaves, while the frames from the leaf node to the root node only need to be transmitted to the root node. The frames are not copied between the leaf nodes. It is mainly used in IPTV. The RL08 device does not support the EVC directly, but it can support indirectly by configuring the port isolation and L3 forwarding between UNIs.

Anti-Attack Detection Configuration

Overview

The chapter describes the configurations of the attack detection and scan detection.

Pseudo-source Address

Pseudo-source address is always the most common method used by the attacker for session hijack and DOS attack. The detection for this kind of packets is with technology. The most common detection is to configure the access list at the receiving direction on the interface to perform the packet filtering, but the detection is limited. The firewall function is enhanced this time. Meanwhile, other detection mechanisms are added. The detection is not omnipotent and not all the packets are valid, which does not mean that all detected packets are invalid.

The detection is performed in the following aspects:

1. Whether the receiving port is correct: If the interface that receives one packet does not have the route to the source address, the route depends on the other interfaces, and the packet is held up (even it is not the deception of the pseudo-source address, it is at least abnormal);
2. The route to the source address of the packet cannot be found on the router and the packet is held up;
3. Seeing from the source address, it is the direct route (belonging to Ethernet) or interface router, but the corresponding items of the source MAC address and source IP address cannot be found in the ARP table, that is, the corresponding IP address of the MAC address is not consistent with the source IP address of the packet. It is likely to be deception. Hold up the packet.

4. Seeing from the source address, it is the gateway route, but the source address of the packet is the physical address of the gateway. It is likely to be deception. Hold up the packet.
5. The other packets: Release the normal or un-determined packets.

Pseudo-source address detection	
Interface	To detect the pseudo source
interface vlan1	<input type="checkbox"/>
interface vlan12	<input type="checkbox"/>

Attack Detection

LAND Attack Detection

Introduction to LAND

LAND attack uses another disadvantage of the system, that is, many systems do not know how to deal with the problem that the SYN connection request whose source address and port number are equal to the destination address and port number results in the disorder or breakdown of the system. Therefore, if it is found that the source address of one packet is equal to the destination address and the source port number is equal to the destination port number, discard the packet.

ip tcp intercept land Configuration

To detect and defend the land attack

You only need to decide whether to enable the detection.

ICMP flood Attack Detection

Introduction to ICMP flood

ICMP flood attack occupies the bandwidth by sending lots of ICMP packets to the target IP so that the valid packets cannot reach the destination, reaching the purpose of attack. During detection, record the ICMP packets whose destination addresses are L3 interface addresses of the switch. Once the receiving frequency of packets is higher than the normal range, it is doubted that there is attack and the flow frequency of packets is controlled strictly until the frequency is lower than the normal range. The processing method has some limitation, that is, the valid packets are also denied when denying the excessive packets. However, considering the bearing capability of the system, the method is the most reasonable.

ip icmp intercept Configuration

To detect and defend the icmp flood attack		
<input type="checkbox"/>	ALC(number or name)	Maxcount
<input type="checkbox"/>	aclname	20
<input type="button" value="Add"/> <input type="button" value="Delete"/>		

Click to configure new ICMP flood attack detection. Select the desired ICMP flood attack detection configurations, and click to delete them.

To configure attack detection		Current attack detection: icmp flood	
ACL	<input type="text"/>	Detection Threshold	<input type="text"/>
<input type="button" value="Add"/> <input type="button" value="Cancel"/>			

ACL: The ACL can be serial No., a number between 1 and 1000. It can also be the name of the ACL and only the standard ACLs are supported (the same below).

SYN flood Attack Detection

Introduction to SYN flood

SYN flood is the most famous attack for consuming the limited resources of the system. It is an attack of deliberate three-way handshake invasion and opening a large number of half-open TCP / IP connections. The attack adopts the IP deception to send the SYN request that seems to be valid to the attacked system. But in fact, the source address does not exist or is not online at the moment. Therefore, the response ACK message cannot reach the destination, while the attacked system is full of the half-open connections and the resources are consumed up. The valid connections cannot be responded. For the attack, you can use a simple holdup mode, that is, threshold holdup. Once the packet frequency of the SYN request received by one server exceeds the threshold, hold up the excessive. On one hand, the SYN attack intensity is reduced; on the other hand, it does not consume too many router resources and result in itself denying services. Note that the validity of the SYN packet is not distinguished, so it also results in the holdup of some valid requests. You can combine the pseudo-source address detection function to filter most attack packets, reducing the number of the valid packets that are held up.

ip tcp intercept list Configuration

To detect and defend the syn flood attack		
<input type="checkbox"/>	ALC(number or name)	Maxcount
<input type="checkbox"/>	acl	100
<input type="button" value="Add"/> <input type="button" value="Delete"/>		

Click **Add** to configure new syn flood attack detection; select the desired syn flood attack detection configuration and click **Delete** to delete it.

To configure attack detection		Current attack detection: syn flood	
ACL	<input type="text"/>	Detection Threshold	<input type="text"/>
		<input type="button" value="Add"/> <input type="button" value="Cancel"/>	

Smurf Attack Detection

Introduction to Smurf

Smurf is also a kind of attack. The attacker first uses the address of the attacked host to send ICMP response request to one broadcast address; hundreds of PCs on the broadcast network make response; lots of response packets are sent to the attacked host. The result of the attack is the same as that of ICMP flood and more secret. This kind of packets can be held up by two methods. If pseudo-source address detection can find the packets, deny them directly. Besides, enable the smurf detection switch. If the source address is the address of the protected destination server, while the destination address is one broadcast address, hold up the packet. The smurf attack adopts the ICMP_ECHO packet, but considering that the other ICMP request packets can also lead to the same consequence, the detection is extended to ICMP_TSTAMP, ICMP_IREQ, and ICMP_MASKREQ packets.

ip smurf intercept Configuration

To detect and defend the smurf attack		
<input type="checkbox"/>	ALC(number or name)	Masklen
<input type="checkbox"/>	adname	50
<input type="button" value="Add"/> <input type="button" value="Delete"/>		

Click **Add** to configure new smurf attack detection. Select the desired smurf attack detection configuration and click **Delete** to delete it.

To configure attack detection		Current attack detection: smurf	
ACL	<input type="text"/>	Mask-len	<input type="text"/>
		<input type="button" value="Add"/> <input type="button" value="Cancel"/>	

Fraggle Attack Detection

Introduction to Fraggle

Strictly speaking, fraggle attack is the variant of smurf. When there are many firewalls to detect the ICMP packets strictly, fraggle does not send ICMP request packet to the broadcast address any more, but sends UDP

packets. When the PC of the destination segment receives the packet and finds that the destination port is unavailable, it sends one error packet of “the destination port is unavailable” to the attacked host. Lots of error packets rush into the attacked host at the same time, reaching the purpose of attacking the host. The fraggle attack detection is similar to smurf.

ip fraggle intercept Configuration

To detect and defend the fraggle attack		
<input type="checkbox"/>	ALC(number or name)	Masklen
<input type="checkbox"/>	acl	260
<input type="button" value="Add"/> <input type="button" value="Delete"/>		

Click to configure new fraggle attack detection. Select the desired fraggle attack detection configuration and click to delete it.

To configure attack detection		Current attack detection: fraggle	
ACL	<input type="text"/>	Mask-len	<input type="text"/>
<input type="button" value="Add"/> <input type="button" value="Cancel"/>			

Scan Detection

Introduction to Scan Detection

The scan detection module can find the address scan and port scan attacks. By default, the system has a set of scan detection thresholds. The user can customize the scan threshold to reach the more detailed scan detection. When it is found that the scan happens to one address, the user can define prohibiting the access in a small period of time. The default value is 15s. Meanwhile, the system records the IP scan in the log for the user to analyze.

Scan Detection Configuration

Scan Detection		<input type="checkbox"/> To clear the scan statistics information	
Interface	To enable the scan detection function	Custom the scan detection function	Custom Detail
interface vlan1	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	Interval <input type="text" value="1500"/> Addr-limit <input type="text" value="20"/> Port-limit <input type="text" value="20"/> Ban-source IP <input type="text" value="40"/>
interface vlan12	<input type="checkbox"/>	<input type="checkbox"/>	

 Note

After the scan detection configuration is complete, click  to save the configuration.

Static Route Configuration

Overview

The chapter describes the static route configuration.

Introduction to Static Route

The static route is the customized route and is configured by the user manually. It makes the transmission of the IP packet between the source and destination adopt the specified path.

Compared with the dynamic routing protocol, the advantages of the static route include the security and the resource efficiency. The static route does not need to occupy the line bandwidth like the dynamic routing protocol. It can improve the network performance and does not need to occupy the CPU period to calculate and notify the route. The disadvantage is that when the network topology changes, it does not have the auto re-configuration mechanism and needs the user to configure manually.

The static route can be re-distributed to the dynamic routing protocol, but the route of the dynamic routing protocol cannot be re-distributed to the static route table. Besides, the route loop caused by configuring the static route cannot be avoided.

The static route is useful for the security of the small network. For example, there is only one path connected to the outer network. For the large-scale network, the static route can perform the security control for some services or links. Most networks adopt the dynamic routing protocol between the network devices, but one or two static routes can be configured for some special cases.

Configure Static Route

Configuring static route includes:

- Set the adding/deleting of static route;
- Set the management distance of static route;

Static route information				
Destination address	Subnet mask	Gateway	Distance metric	Config
0.0.0.0	255.255.0.0	130.255.3.254		×

Destination: Mask: Gateway: Metric:

Click to add the configurations items of the static route.

DNS Configuration

Overview

This chapter describes the DNS configuration.

DNS Server Configuration

IP defines one naming method, allowing one device to be identified by its location in IP. It is one hierarchical naming method for the domain. To keep the tracking of the domain name, IP defines the name server, which keeps the buffer (or database) of mapping the domain name to the IP address. To map the domain name to IP address, you first need to identify the host name and then specify the domain name server to make the domain naming system take effect. This is the global naming scheme of the Internet identifying the network device.

The **Preferred DNS server** and **Alternate DNS server** can be configured.

DNS configuration	
Preferred DNS server:	<input type="text" value="130.255.0.180"/>
Alternate DNS server:	<input type="text" value="130.255.0.171"/>
<input type="button" value="Apply"/> <input type="button" value="Refresh"/>	

System Management

Overview

This chapter describes the system management configuration.

Basic Information Configuration

In Maipu switch, the main tasks of the system configuration are:

- Configure system name
- Configure system time

		NTP configuration
System Name	<input type="text" value="switch163"/>	
System Time	<input type="text" value="01/06/2009 17:34"/>	
UserName	<input type="text"/>	
TEL	<input type="text"/>	
Address	<input type="text"/>	
<input type="button" value="Configure"/> <input type="button" value="Refresh"/>		

NTP Configuration

Click [NTP configuration](#) to enter the NTP configuration interface.

NTP Client Configuration

For the NTP client, the following items can be configured:

- Authentication-key
- Authenticate
- NTP Server

- Trusted-key

Besides, the Master configured on the server is cleared.

Authentication-key Configuration

Authentication-key	Key Number	<input type="text"/>	(range:1-4294967295)	+
	Key	<input type="text"/>	(maxlength:32)	
	Key number	Key		
	1	*****		X

Click + to add configuration; click X to delete the configuration.

Authenticate Configuration

Authenticate	<input type="checkbox"/>
---------------------	--------------------------

You only need to tick the check box.

NTP Server Configuration

NTP Server	Server	<input type="text"/>	(format:A.B.C.D)	+
	Version	<input type="text"/>	(range:1-4,default:4)	
	Key	<input type="text"/>	(range:1-4294967295)	
	Server	Version	Key	
	130.255.0.155	1	5	X

Click + to add configuration; click X to delete the configuration.

Trusted-key Configuration

Trusted-key	<input type="text"/>	(range:1-4294967295)	+
	Trusted-key		
	4		X

Click + to add configuration; click X to delete the configuration.

NTP Server Configuration

For the NTP server, the following items can be configured:

- Master
- Authentication-key

Master Configuration

Configure NTP												
<input type="radio"/> Configured As Client <input checked="" type="radio"/> Configured As Server												
Master	<input type="text"/> (range:2-15)											
Authentication-key	<table border="1"> <tr> <td>Key Number</td> <td><input type="text"/> (range:1-4294967295)</td> <td rowspan="2">+</td> </tr> <tr> <td>Key</td> <td><input type="text"/> (maxlength:32)</td> </tr> <tr> <td>Key number</td> <td>Key</td> <td></td> </tr> <tr> <td>1</td> <td>*****</td> <td>X</td> </tr> </table>	Key Number	<input type="text"/> (range:1-4294967295)	+	Key	<input type="text"/> (maxlength:32)	Key number	Key		1	*****	X
	Key Number	<input type="text"/> (range:1-4294967295)	+									
	Key	<input type="text"/> (maxlength:32)										
Key number	Key											
1	*****	X										
<input type="button" value="OK"/> <input type="button" value="Back"/>												

Authentication-key Configuration.

The same as **Authentication-key Configuration** in the section *NTP Client Configuration*

Administrator Configuration

Set the passwords of administrator and guest, set the password for entering the enable mode, set whether to enable guest user, and so on.

Set the password of the administrator as follows:

Change the Login password	
Username:	<input type="text" value="admin"/>
New password:	<input type="text"/>
Confirm the password:	<input type="text"/>
<input type="button" value="Apply"/>	

Set the password of the guest as follows:

Change the Login password	
Username:	<input type="text" value="guest"/>
New password:	<input type="text"/>
Confirm the password:	<input type="text"/>
<input type="button" value="Apply"/>	

Set the password for entering the enable mode as follows:

Set the enable password.	
New password:	<input type="text"/> <input type="button" value="Apply"/>

Set whether to enable the guest user as follows:

Enable or disable the guest user	<input checked="" type="radio"/> Enable <input type="radio"/> Disable
---	---

Device Software Upgrade

The system can select two kinds of file upgrade.

WEB file (*.rom)

ISO file (*.bin)

WEB filename:	<input type="text"/>	<input type="button" value="Browse..."/>	<input type="button" value="Update"/>	(Update the WEB program need not to restart the device.)
----------------------	----------------------	--	---------------------------------------	---

IOS filename:	<input type="text"/>	<input type="button" value="Browse..."/>	<input type="button" value="Update"/>	(The update of the IOS program need to restart the device to take effect.)
----------------------	----------------------	--	---------------------------------------	---

Click **Browse** to select the desired upgrade file.

 Note

Re-start the device. The IOS program upgrade can take effect only after restarting the device.

Configuration File Management

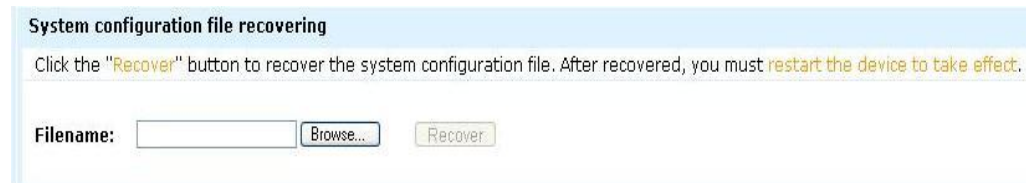

File management configuration includes:

The backup of the configuration files in the system:

Backup the configuration file of system
Click the "Backup" button to download system configuration file.
<input type="button" value="Backup"/>

Click **Backup** to back up the configuration files of the device to the local.

The recovering of the configuration files in the system:

System configuration file recovering

Click the "Recover" button to recover the system configuration file. After recovered, you must restart the device to take effect.

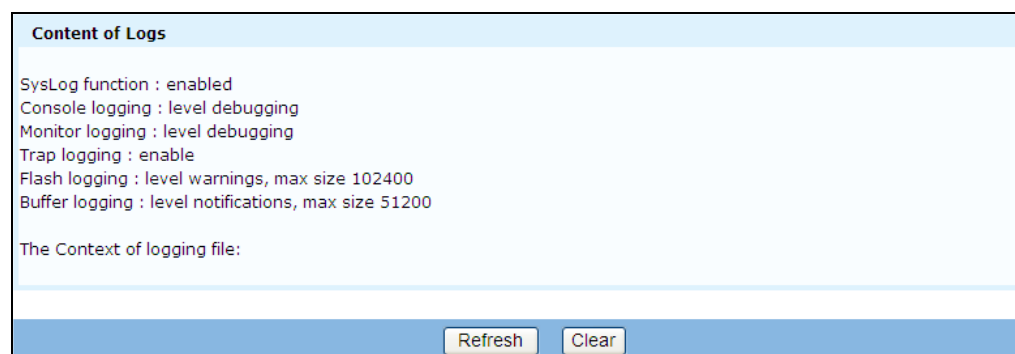

Filename:

To recover to the previous configuration, find the desired configuration file at the local and click **Recover**.

Log Management

The system log function includes two aspects:

- Add some header information to the printed log message, such as time stamp and task name;
- Output and save the log message in various forms, including printing to the console port, printing to the telnet terminal via the switch, writing to the memory, writing to the flash file, sending to the log server and so on;

Content of Logs

SysLog function : enabled
Console logging : level debugging
Monitor logging : level debugging
Trap logging : enable
Flash logging : level warnings, max size 102400
Buffer logging : level notifications, max size 51200

The Context of logging file:

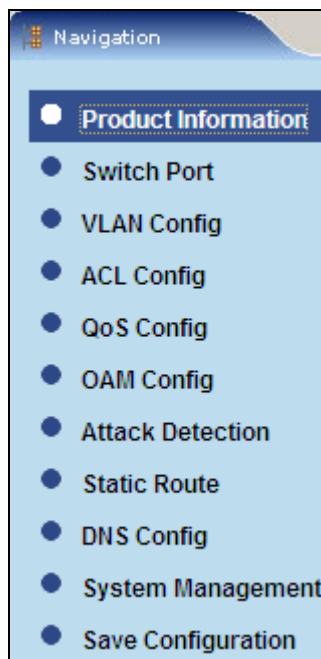

You can click to update the log information; click to clear the current log information.

Save Configuration

Overview

The save function is to save all current configurations to the device.

After modifying the system configuration, the user can save the current configuration as the configuration parameters for enabling the switch next time

Click **Save Configuration** in the navigation and the system prompts a dialog box. Click **OK** to save the configuration or **Cancel** to cancel the saving operation.
