Chapter 1: Introduction

Thank you for choosing the W307R Wireless-N Broadband Router. It employs the advanced MIMO (Multi Input, Multi Output) technology and integrates router, wireless access point, four-port switch and firewall in one, which will allow you to share Internet access over the four switched ports or via the wireless broadcast. Compatible with IEEE 802.11n (Draft 2.0) standard, it can connect with existing 802.11b/g PCI, USB and Notebook adapters. Up to 300Mbps transmission rate allows you to enjoy real-time activities such as video streaming, online gaming and so on.

Besides, the Wireless-N Broadband Router supports all of the latest wireless security features, such as 64/128-bit WEP encryption, WPS (PBC and PIN) encryption method, packet filtering and port forwarding, to prevent unauthorized access and protect your network against malicious attack.

Moreover, the user-friendly Setup Wizard on the CD-ROM can assist you to set up the Wireless-N Broadband Router easily. It also can be managed or configured through Local/Remote easy-to-use Web-based utility. So it is the best choice for SOHOs and small-sized enterprises.

Package Contents

- ◆ One W307R Wireless-N Broadband Router
- ◆ One Ethernet Network Cable
- ◆ One Quick Installation Guide
- ◆ One Power Adapter
- ◆ One CD-ROM

If any of listed items are missing or damaged, please contact the Tenda reseller from whom you purchased for replacement immediately.

Chapter 2: Getting to Know the Wireless-N Broadband Router

The Rear Panel

Here is the description of the back panel. The RJ-45 ports for cable connection and Reset button are located on the back panel as shown below.

Connections:

Rear Panel Interface	Description
1-4 (LAN Ports)	Connect to Ethernet devices (such as computers, switches, hubs).
RESET/WPS	Note: After pressing the RESET button for 7 seconds, the configurations you have set will be deleted and the device will restore to the factory default settings. If you press this button for 1 second, the WPS (PBC) function is enabled.
WAN	Connect to DSL Modem, Cable Modem or community broadband
POWER	Receptor for the supplied power adapter.

The Top Panel

There are the Router's LED indicators on the top panel as shown below.

LEDS:

LED Indicator	Status	Description
POWER	Always ON	The POWER indicator is Always ON when it is powered on and works properly.
SYS	Blinking	The SYS is blinking regularly when the system works normally.
WAN	Always ON	Indicates the correct connection of the WAN ports.
	Blinking	Indicates the Router is transmitting/receiving data packets.
WLAN	Blinking	Indicates the wireless signal is OK.
LAN(1/2/3/4)	Always ON	Indicates the correct connection of the LAN ports.
	Blinking	Indicates the Router is transmitting/receiving data packets.
WPS	Blinking	Indicates the Router is negotiating with WPS clients in WPS Mode (PBC or PIN).

Hardware Installation

1. Please connect the LAN port of the router to the network adapter of your computer with one cable.

2. Please use the delivery-attached power adapter to power the router.

3. Please connect your broadband line provided by your ISP to the WAN port of your router.

IMPORTANT: Please use the included power adapter. Use of a different power adapter could cause damage and void the warranty for this product.

Chapter 3: Getting to Connect the Wireless-N Broadband Router

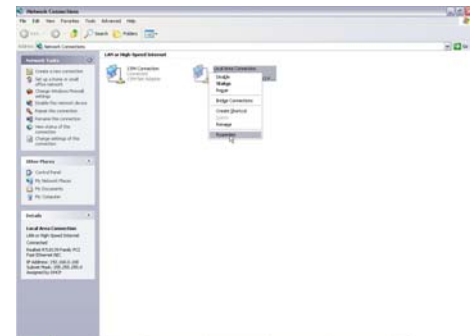

For easy and fast configuration, the following steps for network configuration are required.

How to Set the Network Configurations for My Computer

Right click **“My Network Places”** and select **“Properties”**.

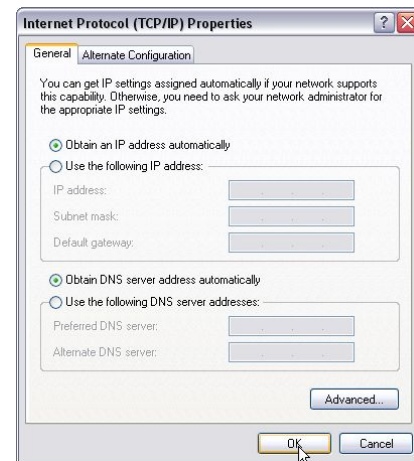

Right click **“Local Area Network Connection”** and select **“Properties”**.

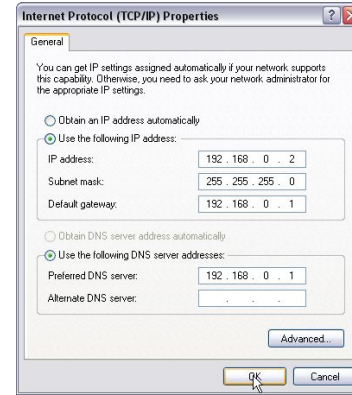

Select **“Internet Protocol (TCP/IP)”** and click **“Properties”**.

Select **“Obtain an IP address automatically”** and **“Obtain DNS server address automatically”**. Click **“OK”** to save the configurations.

Or select **“Use the following IP address”** and enter the IP address, Subnet mask, Default gateway as shown right. Of course, you need to input the DNS server address provided by your ISP. Otherwise, you can use the Router’s default gateway as the DNS proxy server. Click **“OK”** to save the configurations.

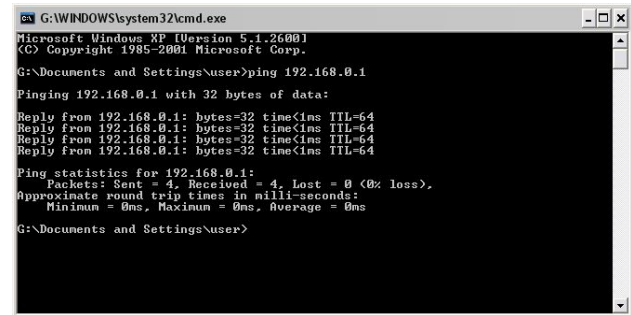

How to Check the Network Connection

Select **“Start”**— **“Programs”**— **“Accessories”**
— **“Command Prompt”**.

Input the “**ping 192.168.0.1**” and press “**Enter**”. If the screen displays as the right figure, it means your PC is connected to your router successfully.

If not, please make sure the hardware installation and network adapter are OK. After all preparations are made, please proceed to Chapter 4 for more and advanced configuration.

Chapter 4 Basic Configurations

This section is to show you how to configure your new Wireless-N Broadband Router through the Web-based Configuration Utility.

How to Access the Web-based Configuration Utility

To access the Router's Web-based Utility, launch a web browser such as Internet Explorer or Firefox and enter the Router's default IP address, `http://192.168.0.1`. Press **“Enter”**.

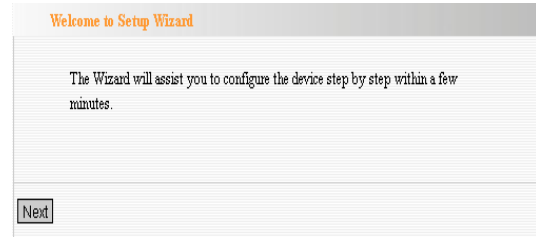

Please input the **“admin”** in both User Name and Password. Click **“OK”**.

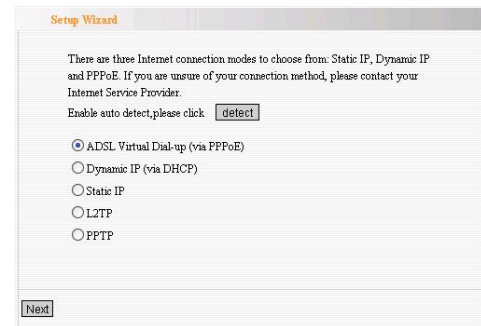

Setup Wizard

Here is the “**Welcome to Setup Wizard**” for configuring your Router quickly. Click “**Next**”.

In this screen, select one mode of your Internet connection you use. If you are not clear, press the “**Detect**” button or contact your Internet Service Provider, and click “**Next**”.

➔**Connection Mode 1: ADSL Virtual Dial-up**
(Via PPPoE)

Enter the Account and Password provided by your ISP, and click “**Next**”.

→Connection Mode 2: Dynamic IP (Via DHCP)

If your connection mode is Dynamic IP, it means your IP address keeps changing every time you connect. You do not need to enter the information like Mode 2 or Mode 3.

→Connection Mode 3: Static IP

In this screen, fill the network address information from your ISP in the IP Address, Subnet Mask, Gateway and Primary DNS server fields and click "**Next**".

The screenshot shows the 'Setup Wizard-Static IP' configuration screen. It contains the following fields and text:

- Title: Setup Wizard-Static IP
- Text: This Internet connection mode requires network address information from your Internet service provider.
- IP Address:
- Subnet Mask:
- Gateway:
- Primary DNS Server:
- Secondary DNS Server: (optional)
- Buttons: Back | Next

→Connection Mode 4: L2TP

Select L2TP (Layer 2 Tunneling Protocol) if your ISP use a L2TP connection, your ISP will provide you with a username and password please fill in the parameters.

L2TP provides two access modes.

If the L2TP offered by your ISP is **Dynamic IP**: Please select Dynamic IP.

The screenshot shows the 'Setup Wizard-L2TP' configuration screen. It contains the following fields and text:

- Title: Setup Wizard-L2TP
- L2TP Server IP Address:
- User Name:
- Password:
- IP Address: (dropdown menu)
- Address Mode:
- Subnet Mask:
- Default Gateway:
- Buttons: back | next

If the L2TP offered by your ISP is **Static IP**:
Please fill in the parameters provided by your ISP.

After configuration, please click “Next”.

→Connection Mode 5: PPTP

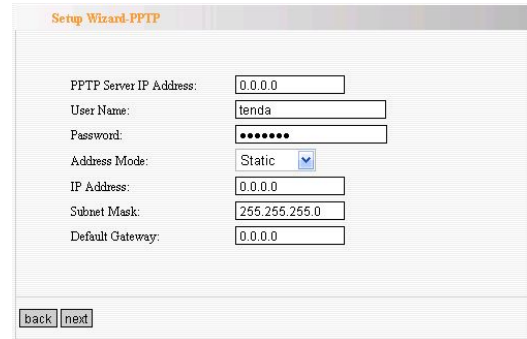

If the connection is “PPP Tunneling Protocol”,
please input the following parameters provided
by your ISP: Server IP Address, User Name,
and Password.

PPTP provides two access modes.

If the PPTP offered by your ISP is **Dynamic IP**:
Please select Dynamic IP.

If the PPTP offered by your ISP is **Static IP**:
Please fill in the parameters provided by your ISP.

After configuration, please click “Next”.

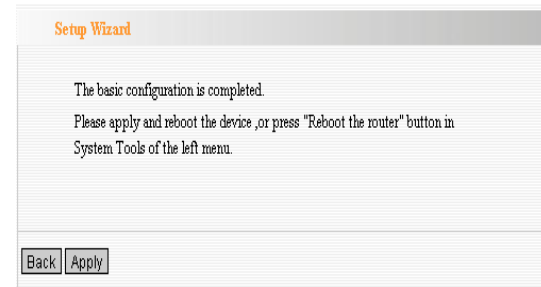

The screenshot shows the 'Setup Wizard PPTP' configuration page. It contains the following fields and options:

PPTP Server IP Address:	<input type="text" value="0.0.0.0"/>
User Name:	<input type="text" value="tenda"/>
Password:	<input type="password" value="*****"/>
Address Mode:	<input type="button" value="Static"/> <input type="button" value="Dynamic"/>
IP Address:	<input type="text" value="0.0.0.0"/>
Subnet Mask:	<input type="text" value="255.255.255.0"/>
Default Gateway:	<input type="text" value="0.0.0.0"/>

At the bottom, there are 'back' and 'next' buttons.

Click “**Apply**”, select “**Reboot**” in **System Tools**
of the left menu and press the “**Reboot the
router**” button.

The screenshot shows the 'Setup Wizard' completion page. It contains the following text:

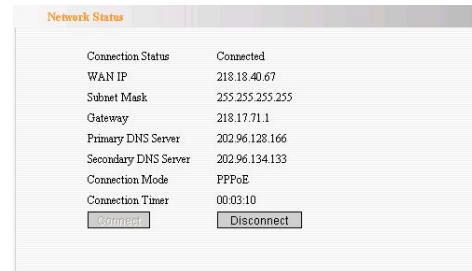

The basic configuration is completed.
Please apply and reboot the device ,or press "Reboot the router" button in
System Tools of the left menu.

At the bottom, there are 'Back' and 'Apply' buttons.

It is rebooting now, please wait for a few minutes and **DO NOT** power off it.

Click the “**System Status**” in the left menu of the Web-based Utility to find out the current network and system information. If the “Connection Status” is “Connected”, Congratulations you on completing the Router’s basic settings. You are on the Internet now. If you want to configure more, please proceed to the following explanations for Advanced Settings.

Chapter 5: Advanced Settings

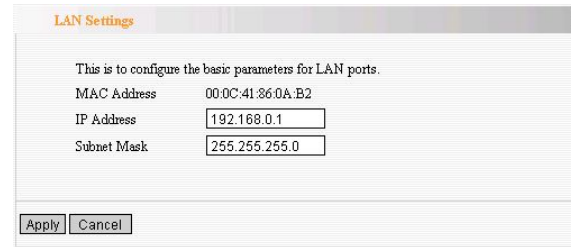

This section is to conduct the advanced configurations for the Router, including LAN Settings, WAN settings, MAC Address Clone and DNS Settings.

LAN Settings

MAC Address: The Router's physical MAC address as seen on your local network, which is unchangeable.

IP Address: The Router's LAN IP address (not your PC's IP address). Once you modify the IP address, you need to remember it for the Web-based Utility login next time. 192.168.0.1 is the default value.

Subnet Mask: It's shown the Router's subnet mask for measurement of the network size. 255.255.255.0 is the default value.

LAN Settings

This is to configure the basic parameters for LAN ports.

MAC Address 00:0C:41:86:0A:B2

IP Address

Subnet Mask

WAN Settings—PPPoE

Connection Mode: Show your current connection mode.

Account: Enter them provided by your ISP.

Password: Enter them provided by your ISP.

MTU: Maximum Transmission Unit. It is the size of largest datagram that can be sent over a network. The default value is 1492. **Do NOT** modify it unless necessary.

Service Name: It is defined as a set of characteristics that are applied to a PPPoE connection. Enter it if provided. **Do NOT** modify it unless necessary.

AC Name: Enter it if provided. **Do NOT** modify it unless necessary.

Connect automatically to the Internet after rebooting the system or connection failure.

Connect Manually: Connect to the Internet by the user manually.

Connect on Demand: Re-establish your connection to the Internet after the specific time (Max Idle Time). Zero means your Internet connection at all time. Otherwise, enter the minutes to be elapsed before you want to disconnect the Internet access.

Connect on Fixed Time: Connect to the

The screenshot shows the WAN Settings interface for a PPPoE connection. The title is "WAN Settings". Below the title, it says "WAN connection mode: PPPoE". There are several input fields: "Account" with the value "szfcq179@163.gd", "Password" with masked characters, "MTU" with the value "1492" and a note "(Default by 1492. Do NOT Modify Unless Necessary)", "Service Name" with a note "(Do NOT Modify Unless Necessary)", and "AC Name" with a note "(Do NOT Modify Unless Necessary)". Under "Internet Connection Option", there are three radio buttons: "Connect Automatically." (selected), "Connect Manually.", and "Connect on Demand". Below "Connect on Demand" is a "Max Idle Time" field with the value "180" and a note "(60—3600 seconds)". Below "Connect on Fixed Time" is a note "IMPORTANT: Please set the time in 'System Tools' before you select this Internet connection." and a "Time" field with values "0" h "0" m T "23" h "00" m. At the bottom, there are "Apply" and "Cancel" buttons.

Internet during the time you fix.

WAN Settings—Static IP

If your connection mode, static IP is chosen, please enter the following addressing information.

IP Address: Here enter the WAN IP address provided by your ISP.

Subnet Mask: Enter the WAN Subnet Mask here.

Gateway: Enter the WAN Gateway here.

Primary DNS Server: Enter the Primary DNS server provided by your ISP.

Secondary DNS Server: Enter the secondary DNS

WAN Settings

WAN connection mode: Static IP

IP Address

Netmask

Gateway

Primary DNS Server

Secondary DNS Server (option)

WAN Settings—L2TP

L2TP Server IP: Enter the Server IP provided by your ISP.

User Name: Enter L2TP username.

Password: Enter L2TP password.

MTU: Maximum Transmission Unit, you may need to change it for optimal performance with your specific ISP. 1400 is the default MTU.

Address Mode: Select “Static” if your ISP supplies you with the IP address, subnet mask, and gateway. In most cases, select Dynamic.

IP Address: Enter the L2TP IP address supplied by your ISP.

Subnet Mask: Enter the Subnet Mask supplied by your ISP.

Default Gateway: Enter the Default Gateway supplied by your ISP.

The screenshot shows the WAN Settings interface for L2TP. The title is "WAN Settings" in orange. Below it, the configuration options are as follows:

WAN connection mode:	L2TP
L2TP Server IP:	<input type="text" value="0.0.0.0"/>
User Name:	<input type="text" value="tenda"/>
Password:	<input type="password" value="••••••••"/>
MTU:	<input type="text" value="1400"/>
Address Mode:	Static <input type="button" value="v"/>
IP Address:	<input type="text" value="0.0.0.0"/>
Subnet Mask:	<input type="text" value="255.255.255.0"/>
Default Gateway:	<input type="text" value="0.0.0.0"/>

At the bottom of the form, there are two buttons: "Apply" and "Cancel".

WAN Settings—PPTP

PPTP Server IP: Enter the Server IP provided by your ISP.

User Name: Enter PPTP username provided by your ISP.

Password: Enter PPTP password provided by your ISP.

Address Mode: Select “Static” if your ISP supplies you with the IP address, subnet mask, and gateway. In most cases, select Dynamic.

IP Address: Enter the PPTP IP address supplied by your ISP.

Subnet Mask: Enter the Subnet Mask supplied by your ISP.

Default Gateway: Enter the Default Gateway supplied by your ISP.

Setup Wizard - PPTP

PPTP Server IP Address:

User Name:

Password:

Address Mode: ▼

IP Address:

Subnet Mask:

Default Gateway:

MAC Address Clone

Some ISPs require end-user's MAC address to access their network. This feature copies the MAC address of your network device to the Router.

MAC Address: The MAC address to be registered with your Internet service provider.

Clone MAC address: Register your PC's MAC address.

Restore default MAC address: Restore the default hardware MAC address.

The screenshot shows a web interface for configuring MAC address cloning. At the top, the title "MAC Address Clone" is displayed in orange. Below the title, the text "WAN MAC Address Clone." is shown. A label "MAC Address:" is followed by a text input field containing the value "02:10:17:F2:AB:12". Below the input field are two buttons: "Restore Default MAC" and "Clone MAC Address". At the bottom of the form, there are two buttons: "Apply" and "Cancel".

DNS Settings

DNS is short for Domain Name System(or Service), an Internet service that translate domain names into IP addresses which are provided by your Internet Service Provider. Please consult your Internet Service Provider for details if you do not have them.

DNS:

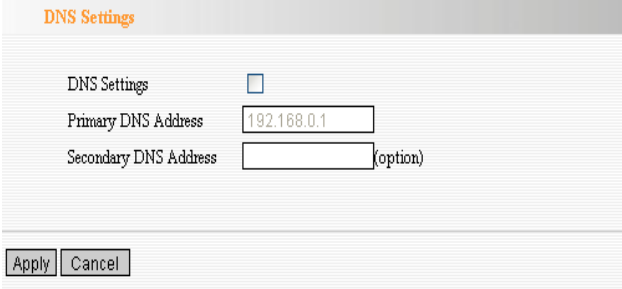

Click the checkbox to enable the DNS server.

Primary DNS Address:

Enter the necessary address provided by your ISP.

Secondary DNS Address:

Enter the second address if your ISP provides, which is optional.

The screenshot shows the 'DNS Settings' page. At the top, the title 'DNS Settings' is displayed in orange. Below the title, there is a checkbox labeled 'DNS Settings' which is currently unchecked. Underneath, there are two text input fields: 'Primary DNS Address' containing the value '192.168.0.1' and 'Secondary DNS Address' which is empty and followed by '(option)'. At the bottom of the form, there are two buttons: 'Apply' and 'Cancel'.

Chapter 6: Wireless Settings

This section mainly deals with the wireless settings, including Basic Settings, Security Setting, Access Control and Advanced Settings.

Wireless Mode

AP Mode: router serves as an access point in this mode to be connected. The work stations around will be connected with router by SSID to share the Internet resources. To configure the AP mode, open the Basic Setting and Security Setting windows in the Wireless Setting folder.

Station Mode: In this mode, router is used as a work station to be connected with an AP by scanning the AP's SSID and provides the security authentication. Generally speaking, AP mode is passive to be connected with work station, but Station mode always takes the initiative in connecting with AP.

SSID: SSID is the unique ID name of access point. The wireless work station must keep the same SSID name with the AP's for connections. By enabling Open Scanning button, the device can search available APs.

The screenshot shows a web-based configuration window titled "Wireless Mode". It contains the following fields and controls:

- Wireless mode:** Two radio buttons, "AP" (selected) and "Station".
- SSID:** A text input field.
- MAC:** A text input field.
- Channel:** A dropdown menu currently showing "1".
- Security Mode:** A dropdown menu currently showing "WEP-PSK".
- Open Scan:** A button located below the Security Mode dropdown.
- Apply** and **Cancel** buttons are located at the bottom left of the window.

MAC: To connect certain AP, you need to know the AP's MAC address. By enabling Open Scanning button to find out the available AP's MAC address.

Channel: You can use the channel same as the AP. By enabling Open Scanning button to find out the available AP's channel.

Security Mode: router provides the following security authentication methods:

(1) WEP: selects ASCII format (5 or 13 ASCII characters except illegal characters.) or Hex format (10 or 26 Hex characters).

(2) WPA/WPA2-personal (PSK) is safer than other encryption methods because the key is subject to change all the time. WPA-PSK/WPA2-PSK utilizes the TKIP or AES encryption algorithm. WEP Mode: The shared key requires the same WEP keys between the access point and work station.

Default KEY: After entering the WEP keys, select one key as the default one, for example, Key 1

KEY Format: AASCII: Enter 13 characters with case sensitive ("a-z", "A-Z" and "0-9"). Hex: enter 26 Hex characters ("A-F", "a-f" and "0~9").

KEY 1: If the KEY 1 is selected as default key, the key will be enabled.

The screenshot shows the 'Wireless Mode' configuration page. At the top, there are radio buttons for 'AP' and 'Station', with 'Station' selected. Below are several configuration fields:

- Wireless mode: AP Station
- SSID:
- MAC:
- Channel:
- Security Mode:
- WEP Mode:
- Default Key:
- Key Format:
- WEP Key 1:
- WEP Key 2:
- WEP Key 3:
- WEP Key 4:

At the bottom right, there is an 'Open Scan' button. At the very bottom of the page, there are 'Apply' and 'Cancel' buttons.

KEY 2: If the KEY 2 is selected as default key, the key will be enabled.

KEY 3: If the KEY 3 is selected as default key, the key will be enabled.

KEY 4: If the KEY 4 is selected as default key, the key will be enabled.

WPA/WPA2 Algorithm: When the WPA-PSK /WPA2-PSK authentication is selected, you can **select one from two:** TKIP and AES. For example, if the wireless provider selects TKIP, the wireless receiver (client) also needs to select TKIP for this authentication way.

Password: When WPA-PSK /WPA2-PSK authentication type is selected, enter the access password provided by AP users here.

Apply: Click “Apply” to make the settings go into effect.

Cancel: Click “Cancel” to throw all setting saved last time.

Basic Settings

Network Mode: Supports 802.11b/g mixed, 802.11b, 802.11g and 802.11b/g/n mixed modes.

Main SSID: Main Service Set Identifier. It's the "name" of your wireless network.

Minor SSID: Minor Service Set Identifier. It is optional.

Broadcast (SSID): Select "enable" to enable the device's SSID to be visible by wireless clients.

BSSID: It is a 48bit identity used to identify a particular BSS (Basic Service Set) within an area.

In Infrastructure BSS networks, the BSSID is the MAC (Medium Access Control) address of the AP

Channel: From the drop-menu, it is for selecting the working channels of the wireless network. Please select from 1 to 13, or select AutoSelect to select different channels.

Channel Bandwidth: Select wireless work frequency 20M or 20/40M.

HT TxStream: RF Transmit Stream.

HT RxStream: RF Receive Stream.

The screenshot shows the 'Basic Settings' configuration page. The settings are as follows:

- Network Mode: 11b/g/n mixed mode (dropdown)
- Main SSID: Tenda (text input)
- Minor SSID: guest (text input)
- Broadcast(SSID): Enable Disable
- BSSID: 00:0C:41:86:0A:B2 (text input)
- Channel: 2437MHz (Channel 6) (dropdown)
- Operating Mode: Mixed Mode Green Field
- Channel BandWidth: 20 20/40
- Guard Interval: long Auto
- MCS: Auto (dropdown)
- Reverse Direction Grant(RDG): Disable Enable
- Extension Channel: 2457MHz (Channel 10) (dropdown)
- Aggregation MSDU (A-MSDU): Disable Enable
- HT TxStream: 2 (dropdown)
- HT RxStream: 2 (dropdown)

At the bottom of the form are 'Save' and 'Cancel' buttons.

Wireless Security Settings

This page is to configure the wireless security of your Router. Six wireless security modes, WEP, WPA-Personal, WPA2-Personal, WPA-Enterprise, WPA2-Enterprise and RADIUS, are supported. If you do not want to use wireless security, select Disable from the drop-down menu.

1. Mixed WEP

WEP (Wired Equivalent Privacy), a basic encryption method, usually encrypts wireless data using a series of digital keys (64 bits or 128 bits in length). By using the same keys on each of your wireless network devices, you can prevent unauthorized wireless devices from monitoring your transmissions or using your wireless resources.

SSID Choice: Select SSID to be configured security. The device supports to configure different security classes between the main SSID and the subordinate SSID.

Security Mode: There are several different security modes; you can choose one from mixed WEP, WPA-Personal, WPA-Enterprise, etc.

Default Key: Select a valid encryption key.

WEP Key1, 2, 3, 4: Enter the WEP key here. Please note that the key should be in accordance with the key format and be valid. The key should be **ASCII Characters** or **Hexadecimal Digits**

The screenshot displays the 'Security Settings' interface for a Tenda router. At the top, the title 'Security Settings' is shown in orange. Below it, the 'SSID Choice' is set to 'Tenda'. The 'Security Mode' is set to 'Mixed WEP'. The 'Default Key' is set to 'Key 1'. There are four 'WEP Key' fields, each containing the value '12345' and an 'ASCII' dropdown menu. At the bottom, there are 'Save' and 'Cancel' buttons.

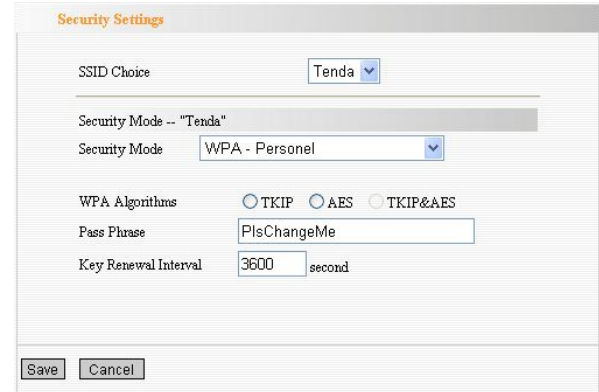

2. WPA-Personal

WPA (Wi-Fi Protected Access), a Wi-Fi standard, is a more recent wireless encryption scheme, designed to improve the security features of WEP. It applies more powerful encryption types (such as TKIP [Temporal Key Integrity Protocol] or AES [Advanced Encryption Standard]) and can change the keys dynamically on every authorized wireless device.

WPA Algorithms: Select one encryption type, AES or TKIP. (AES is stronger than TKIP.)

Pass Phrase: Enter the key which must have 8-63 ASCII characters.

Key Renewal Interval: Enter the key renewal period. It is to tell the Router how often to change the keys.

The screenshot shows the 'Security Settings' page for a Tenda router. The SSID is set to 'Tenda'. The Security Mode is set to 'WPA - Personal'. The WPA Algorithms are set to 'TKIP', 'AES', and 'TKIP&AES'. The Pass Phrase is 'PlsChangeMe'. The Key Renewal Interval is set to '3600' seconds. There are 'Save' and 'Cancel' buttons at the bottom.

SSID Choice	Tenda
Security Mode -- "Tenda"	
Security Mode	WPA - Personal
WPA Algorithms	<input type="radio"/> TKIP <input type="radio"/> AES <input type="radio"/> TKIP&AES
Pass Phrase	PlsChangeMe
Key Renewal Interval	3600 second

Save Cancel

3. WPA2-Personal

WPA2 (Wi-Fi Protected Access version 2), It's more secure than Wired Equivalent Privacy (WEP) and easy to set up.

WPA Algorithms: Select key Algorithms such as TKIP, AES and TKIP&AES.

Pass Phrase: Enter the key which must have 8-63 ASCII characters.

Key Renewal Interval: Enter the key renewal period. It is to tell the Router how often to change the keys.

The screenshot shows the 'Security Settings' page with the following configuration:

- SSID Choice: Tenda
- Security Mode -- "Tenda": WPA2 - Personal
- WPA Algorithms: TKIP, AES, TKIP&AES (all unselected)
- Pass Phrase: PlsChangeMe
- Key Renewal Interval: 3600 second

Buttons: Save, Cancel

4. WPA-Enterprise

This Authentication protocol based on RADIUS server. This security mode is used when a RADIUS server is connected to the Router.

Radius IP Address: Please input IP address of the radius server here.

Radius Port: Please input the port number of the radius server here.

Shared key: The encryption key that the router is authenticated through RADIUS server

Session Timeout: The recertification time interval between the router and the server. The default value is 3600s.

The screenshot shows the 'Security Settings' page with the following configuration:

- SSID Choice: Tenda
- Security Mode -- "Tenda": WPA - Enterprise
- WPA Algorithms: TKIP, AES, TKIP&AES (all unselected)
- Key Renewal Interval: 3600 second
- Radius IP Address: 192.168.0.100
- Radius Port: 1812
- Shared Key: PlsChangeMe
- Session Timeout: 3600

Buttons: Save, Cancel

5. WPA2-Enterprise

This security mode is also used when a RADIUS server is connected to the Router.

WPA Algorithms: Select key Algorithms such as TKIP and AES.

Radius IP Address: Please input IP address of the radius server here.

Radius Port: Please input the port number of the radius server here.

Shared key: The encryption key that the router is authenticated through RADIUS server

Session Timeout: The recertification time interval between the router and the server. The default value is 3600s.

The screenshot displays the 'Security Settings' interface for a Tenda router. The SSID is set to 'Tenda'. The Security Mode is 'WPA2 - Enterprise'. The WPA Algorithms are set to 'TKIP & AES'. The Key Renewal Interval is 3600 seconds, and the PMK Cache Period is 10 minutes. Pre-Authentication is enabled. The Radius IP Address is 192.168.0.100, the Radius Port is 1812, the Shared Key is 'PlsChangeMe', and the Session Timeout is 3600 seconds. There are 'Save' and 'Cancel' buttons at the bottom.

Field	Value
SSID Choice	Tenda
Security Mode -- "Tenda"	WPA2 - Enterprise
WPA Algorithms	<input checked="" type="radio"/> TKIP <input checked="" type="radio"/> AES <input type="radio"/> TKIP&AES
Key Renewal Interval	3600 second
PMK Cache Period	10 minute
Pre-Authentication	<input type="radio"/> Disable <input checked="" type="radio"/> Enable
Radius IP Address	192.168.0.100
Radius Port	1812
Shared Key	PlsChangeMe
Session Timeout	3600

6. 802.1X

This security mode is used when a RADIUS server is connected to the Router. 802.1x, a kind of Port-based authentication protocol, is an authentication type and strategy for users. The port can be either a physic port or logic port (such as VLAN). For wireless LAN users, a port is just a channel. The final purpose of 802.1x authentication is to check if the port can be used. If the port is authenticated successfully, you can open this port which allows all the messages to pass. If the port isn't authenticated successfully, you can keep this port "disable" which just allows 802.1x authentication protocol message to pass.

WEP: Select "enable/disable" WEP encryption which indicates the authentication process between wireless adapter and wireless router.

Radius IP Address: Please input IP address of the radius server here.

Radius Port: Please input the port number of the radius server here.

Shared key: The encryption key that the router is authenticated through RADIUS server.

The screenshot displays the 'Security Settings' page of a Tenda router. The SSID is set to 'Tenda'. The Security Mode is '802.1X'. WEP is currently disabled. The Radius IP Address is '192.168.0.100', the Radius Port is '1812', the Shared Key is 'PlsChangeMe', and the Session Timeout is '3600'. There are 'Save' and 'Cancel' buttons at the bottom of the form.

Session Timeout: The recertification time interval between the router and the server. The default value is 3600s.

⚠NOTE: To improve security level, do not use those words which can be found in a dictionary or too easy to remember! Wireless clients will remember the WEP key, so you only have to input the WEP key on wireless client once, and it's worth to use complicated WEP key to improve security level.

WPS Settings

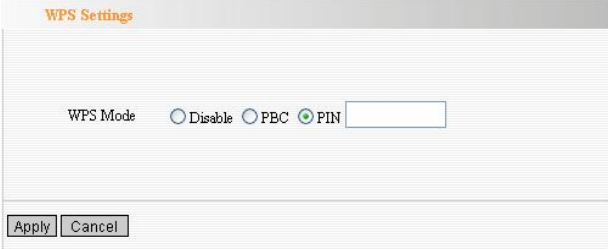

WPS (Wi-Fi Protected Setting) can be easy and quick to establish the connection between the wireless network clients and the Router through encrypted contents. The users only enter the PIN code to configure without selecting encryption method and entering secret keys by manual.

WPS Mode: Supports two ways to configure WPS settings:

PBC (Push-Button Configuration) and PIN code.

PBC: Select the PBC or press the WPS button on the panel of the Router (Press the button for one second and WPS indicator will be blinking for 2 minutes, which means the WPS is enabled. During the blinking time, you can enable another Router to implement the WPS/PBC negotiation between them. At present, the WPS only support one client access. Two minutes later, the WPS indicator will be off.).

PIN: If this option is enabled, you need to enter a wireless client's PIN code in the field and keep the same code in the client.

WPS Settings

WPS Mode Disable PBC PIN

Apply Cancel

WDS Settings

In this mode, you can expand the scope of network by combining up to four other access points together, and every access point can still accept wireless clients.

Lazy Mode: You need configure the router's BSSID into another device, not need input another router's BSSID in it, and then connect together automatically.

Bridge Mode: You can wirelessly connect two or more wired networks via this mode. In this mode, you need to add the Wireless MAC address of the connecting device into the Router's AP MAC address table or select one from the scanning table. At the same time, the connecting device should be in Lazy, Repeater or Bridge mode.

Repeater Mode: You can select the mode to extend the distance between the two WLAN devices. Functioning as a WDS repeater, the W307R connects to both a client card as an AP and to another AP. In typical repeater applications, APs connecting to other APs equipped with WDS functionality must also support WDS. In this mode, you need to add the MAC address of the connecting device into the

Router's AP MAC address table and the connecting client should be in Lazy, Repeater or client mode.

Encrypt Type: You can select WEP mode, TKIP mode, AES mode for security here.

Pass phrase: Enter the key, the key format according to encryption you selected.

AP MAC: Input the MAC address of another wireless router.

⚠ **NOTE:** **Two wireless routers must use the same band, channel number, and security setting!**

This section is to configure the advanced wireless setting of the Router, including the Radio Preamble, 802.11g/n Rate, Fragmentation Threshold, RTS Threshold, Beacon Period and DTIM Interval.

BG protection Mode: Auto by default. You can select On or Off.

Basic Data Rates: For different requirement, you can select one of the suitable Basic Data Rates. Here, default value is (1-2-5.5-11Mbps...).

Beacon Interval: Set the beacon interval of wireless radio. Do not modify default value if you don't know what it is, default value is 100.

Fragment Threshold: Do not modify default value if you don't know what it is, default value is 2346.

RTS Threshold: Set the RTS threshold of wireless radio. Do not modify default value if you don't know what it is, default value is 2347.

TX Power: You can set the output power of wireless radio. Unless you're using this wireless router in a really big space, you may not have to

Advanced Settings

BG Protection Mode	Auto
Basic Data Rates	Default(1-2-5.5-11 Mbps)
Beacon Interval	100 ms (range 20 - 999, default 100)
Fragment Threshold	2346 (range 256 - 2346, default 2346)
RTS Threshold	2347 (range 1 - 2347, default 2347)
TX Power	100 (range 1 - 100, default 100)

WMM Capable Enable Disable

APSD Capable Enable Disable

Save Cancel

set output power to 100%. This will enhance security (malicious / unknown users in distance will not be able to reach your wireless router).

WMM Capable: It will enhance the data transfer performance of multimedia contents when they're being transferred over wireless network. If you don't know what it is / not sure if you need it, it's safe to set this option to 'Enable', however, default value is enabling.

APSD Capable: It is used for auto power-saved service. The default is disabled.

Wireless Access Control

To secure your wireless LAN, the wireless access control is actually based on the MAC address management.

MAC Address Filter: If you want to access the Router from any external IP Address, please select the “Disable”.

MAC Address: To specify an external IP address, please add the MAC address manually and click “Add”.

MAC Address List: The added MAC addresses are listed here. Click “Delete” to delete the filter management for this MAC address.

Wireless Connection Status

This page is to show the current wireless access status. Click “Refresh” to update the wireless connection information.

MAC Address:

Shows the connecting PC’s MAC address.

Bandwidth: displays the channel bandwidth of the host to be connected.

The screenshot shows a web interface titled "Wireless Connection Status". Below the title, there is a label "The Current Wireless Access List:" followed by a "Refresh" button. Below this is a table with three columns: "NO.", "MAC Address", and "Bandwidth".

NO.	MAC Address	Bandwidth
-----	-------------	-----------

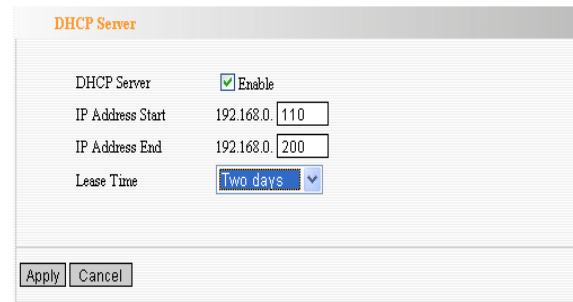

Chapter 7: DHCP Server

DHCP (Dynamic Host Control Protocol) is to assign an IP address to the computers on the LAN/private network. When you enable the DHCP Server, the DHCP Server will allocate automatically an unused IP address from the IP address pool to the requesting computer in premise of activating “Obtain an IP Address Automatically”. So specifying the starting and ending address of the IP Address pool is needed.

DHCP Server: Activate the checkbox to enable DHCP server.

IP Address Start/End: Enter the range of IP address for DHCP server distribution.

Lease Time: The length of the IP address lease.

The screenshot shows the DHCP Server configuration page. It features a title bar 'DHCP Server' in orange. Below it, there are four configuration items: 'DHCP Server' with a checked 'Enable' checkbox, 'IP Address Start' with a text box containing '192.168.0.' and a numeric box containing '110', 'IP Address End' with a text box containing '192.168.0.' and a numeric box containing '200', and 'Lease Time' with a dropdown menu showing 'Two days'. At the bottom, there are 'Apply' and 'Cancel' buttons.

DHCP Server	
DHCP Server	<input checked="" type="checkbox"/> Enable
IP Address Start	192.168.0. <input type="text" value="110"/>
IP Address End	192.168.0. <input type="text" value="200"/>
Lease Time	<input type="text" value="Two days"/>
<input type="button" value="Apply"/> <input type="button" value="Cancel"/>	

DHCP Server List

The Static IP assignment is to add a specifically static IP address to the assigned MAC address. You can view the related information in the DHCP server list.

IP Address: Enter one IP address for the computer on the LAN network.

MAC Address: Enter the MAC address of the computer you want to assign the above IP address. Click “Add” to add the entry in the list.

Hostname: The name of the computer which is added a new IP address.

Lease Time: The time length of the corresponding IP address lease.

DHCP Client List

Chapter 8: Virtual Server

Single Port Forwarding

The W307R can be configured as a virtual server on behalf of local services behind the LAN port. The given remote requests will be re-directed to the local servers via the virtual server. This section deals with the single port forwarding mainly. The Single Port Forwarding allows you to set up kinds of public services such as web servers, ftp, e-mail and other specialized Internet applications on your network.

⚠ NOTE: the virtual server uses known host-name or public IP address.

External Port: This is the external port number for server or Internet application, for example, port 21 for ftp service.

Internal Port: This is the port number of LAN computer set by the Router. The Internet traffic from the external port will forward to the internal port.

For example, you can set the internal port NO.66 to act as the external port NO.21 for ftp service.

IP Address: Enter the IP address of the PC

Single Port Forwarding

The W302R can be configured as a virtual server on behalf of local services behind the LAN port. The given remote requests will be re-directed to the local servers via the virtual server. This section deals with the single port forwarding mainly. The Single Port Forwarding allows you to set up kinds of public services such as web servers, ftp, e-mail and other specialized Internet applications on your network.

Note: the virtual server uses known host-name or public IP address.

Well-Known Service Port: ID

Port Trigger Settings

When internal clients have access to external server in the Internet for some application, the clients request to connect with servers, and the server will also ask to connect with client. But in the default setting, router will refuse to accept any request from WAN, which will bring communication halt. The **port triggering** is used to define triggering rules. So when clients have access to the server, the device will open the port through which the server sends the request to client.

IP Range: The internal IP address range for requesting external server application.

Trigger Port: The port range through which the internal clients send request traffics to external server with the range of 1~65535. Note that the low number first and two blanks can keep the same number if needed.

External Port: The port range through which the external server send request traffics to internal clients with the range of 1~65535. Note that the low number first and two blanks can keep the

Port Trigger Settings

same number if needed.

Apply: To enable or disable the rule.

Add: After edit the rule, click the “add” button to add the current entry to port triggering list.

Apply: Click “Apply” to activate the current rule.

Cancel: Click “Cancel” to drop all setting saved last time.

It is allowed to delete or modify the previous rules in the list table.

Note: The special application can be only used in one PC. If there is more than one PC to open the same triggering port, the external port will be connected to the last PC for the application.

ALG Service Settings

ALG(Application Layer Gateway)

In the context of computer networking, an ALG or application layer gateway consists of a security component that augments a firewall or NAT employed in a computer network. It allows customized NAT traversal filters to be plugged into the gateway to support address and port translation for certain application layer "control/data" protocols such as FTP, BitTorrent, SIP, RTSP, file transfer applications etc.

In order for these protocols to work through NAT or a firewall, either the application has to know about an address/port number combination that allows incoming packets, or the NAT has to monitor the control traffic and open up port mappings (firewall pinhole) dynamically as required. Legitimate application data can thus be passed through the security checks of the firewall or NAT that would have otherwise restricted the traffic for not meeting its limited filter criteria.

Usually allowing client applications to use dynamic ephemeral TCP/ UDP ports to communicate with the known ports used by the

server applications, even though a firewall-configuration may allow only a limited number of known ports. In the absence of an ALG, either the ports would get blocked or the network administrator would need to explicitly open up a large number of ports in the firewall; rendering the network vulnerable to attacks on those ports.

In the default ALG settings, the following protocols have enabled. **It is recommended to keep the settings unchanged.**

- 1,FTP
- 2,TFTP
- 3,PPTP
- 4,IPSec
- 5,L2TP

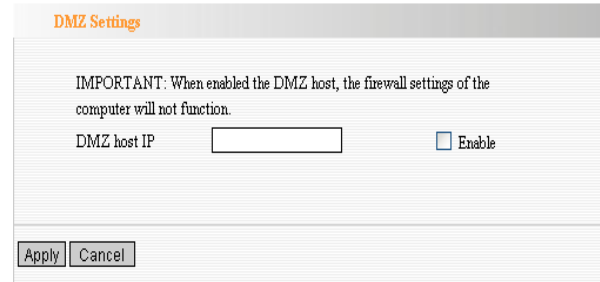

DMZ Settings

The DMZ function is to allow one computer in LAN to be exposed to the Internet for a special-purpose service as Internet gaming or videoconferencing.

DMZ Host IP Address: The IP address of the computer you want to expose.

Enable: Click the checkbox to enable the DMZ host.

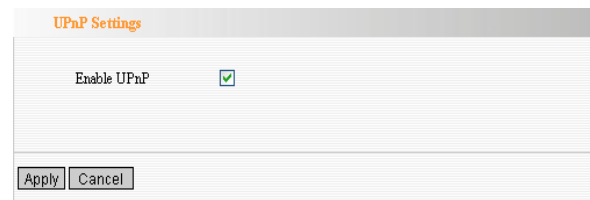

IMPORTANT: When enabled the DMZ host, the firewall settings of the DMZ host will not function.

UPnP Settings

It supports latest Universal Plug and Play. This function goes into effect on Windows XP or Windows ME or this function would go into effect if you have installed software that supports UPnP. With the UPnP function, host in LAN can request the router to process some special port switching so as to enable host outside to visit the resources in the internal host.

Enable UPnP: Click the checkbox to enable the UPnP.

Chapter 9: Traffic Control

Traffic Control

Traffic control is used to limit communication speed in the LAN and WAN. Up to 20 entries can be supported with the capability for at most 254 PCs' speed control, including for IP address range configuration.

Enable Traffic Control: To enable or disable the internal IP bandwidth control.

Interface: To limit the uploading and downloading bandwidth in WAN port.

Service: To select the controlled service type, such as HTTP service.

IP Starting Address: The first IP address for traffic control.

IP Ending Address: The last IP address for traffic control.

Uploading/Downloading: To specify the

traffic heading way for the selected IP addresses: uploading or downloading.

Bandwidth: To specify the uploading/downloading Min. /Max. Traffic speed (KB/s), which can not exceed the WAN speed.

Apply: To enable the current editing rule. If not, the rule will be disabled.

Add: After edit the rule, click the “add to list” button to add the current rule to rule list.

Apply: Click “Save” to activate the current rule.

Cancel: Click “Cancel” to drop all setting saved last time.

It is allowed to delete or modify the previous rules in the list table.

Chapter 10: Security Settings

Client Filter Settings

To benefit your further management to the computers in the LAN, you can control some ports access to Internet by data packet filter function.

Client Filter: Check to enable client filter.

Access Policy: Select one number from the drop-down menu.

Enable: Check to enable the access policy.

Clear the Policy: Click “Clear” button to clear all settings for the policy.

Filter Mode: Click one radio button to enable or disable to access the Internet.

Policy Name: Enter a name for the access policy selected.

IP Start/End: Enter the starting/ending IP address.

Port No.: Enter the port range based over the protocol for access policy.

Protocol: Select one protocol (TCP/UDP/Both) from the drop-down menu.

Times: Select the time range of client filter.

Days: Select the day(s) to run the access policy.

The screenshot shows the 'Client Filter' configuration page. At the top, 'Client Filtering Settings' is checked. Below this, 'Access Policy' is set to '10'. The 'Enable' checkbox is checked, and there is a 'Clear' button next to it. The 'Filtering Mode' section has 'Disable' selected with a radio button, and 'Enable' is unselected. Below this, there are input fields for 'Policy Name', 'Start IP' (192.168.0), 'End IP' (192.168.0), 'Port' (with a range selector), and 'Type' (set to 'TCP'). At the bottom, there are 'Times' dropdowns (0, 0, 0, 0) and a 'Date' section with 'Everyday' checked and other days (Sun, Mon, Tue, Wen, Thr, Fri, Sat) unchecked. 'Apply' and 'Cancel' buttons are at the very bottom.

URL Filter Settings

In order to control the computer to have access to websites. You can use URL filtering to allow the computer to have access to certain websites at fixed time and forbids it having access to certain websites at fixed time.

URL Filter: Check to enable URL filter.

Access Policy: Select one number from the drop-down menu.

Enable: Check to enable the access policy.

Clear the Policy: Click “Clear” button to clear all settings for the policy.

Filter Mode: Click one radio button to enable or disable to access the Internet.

Policy Name: Enter a name for the access policy selected.

Start/End IP: Enter the starting/ending IP address.

DNS: Specify the text strings or keywords in the DNS. If any part of the URL contains these strings or words, the web page will not be accessible and display.

Times: Select the time range of client filter.

Days: Select the day(s) to run the access policy.

URL Filter

URL Filtering Setting: Enable

MAC Address Settings

In order to manage the computers in LAN better, you could control the computer's access to Internet by MAC Address Filter.

MAC Address Filter: Check to enable MAC address filter.

Access Policy: Select one number from the drop-down menu.

Enable: Check to enable the access policy.

Clear the Policy: Click "Clear" button to clear all settings for the policy.

Filter Mode: Click one radio button to enable or disable to access the Internet.

Policy Name: Enter a name for the access policy selected.

MAC Address: Enter the MAC address you want to run the access policy.

Times: Select the time range of client filter.

Days: Select the day(s) to run the access policy.

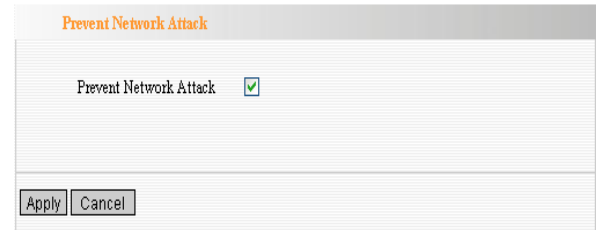

The screenshot shows the 'MAC Filter' configuration page. At the top, 'MAC Filtering Settings' is checked and labeled 'Enable'. Below this, 'Access Policy' is set to '10'. There is an 'Enable' checkbox checked and a 'Delete the Policy' button labeled 'Clear'. The 'Filtering Mode' section has two radio buttons: 'Disable access the Internet' (unchecked) and 'Enable' (checked). The 'Policy Name' field is empty. The 'MAC Address' field consists of six empty boxes. The 'Times' field shows '0' for hour and minute, and '0' for day and month. The 'Date' section has checkboxes for 'Everyday', 'Sun' (checked), 'Mon', 'Tue', 'Wen', 'Thu', 'Fri' (checked), and 'Sat'. At the bottom, there are 'Apply' and 'Cancel' buttons.

Prevent Network Attack

This section is to protect the internal network from exotic attack such as SYN Flooding attack, Smurf attack, LAND attack, etc. Once detecting the unknown attack, the Router will restrict its bandwidth automatically.

The attacker's IP address can be found from the "System Log".

Prevent Network Attack: Check to enable it for attack prevention.

Prevent Network Attack

Apply Cancel

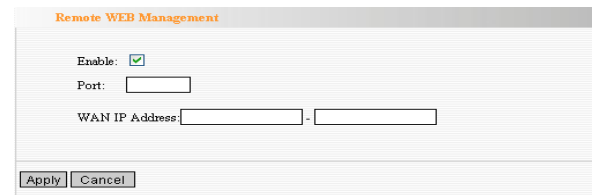

Remote Web Management

This section is to allow the network administrator to manage the Router remotely. If you want to access the Router from outside the local network, please select the "Enable".

Enable: Check to enable remote web management.

Port: The management port open to outside access. The default value is 80.

WAN IP Address: Specify the range of the WAN IP address for remote management.

Remote WEB Management

Chapter 11: Routing Settings

Routing Table

The main duty for router is to look for a best path for every data frame, and transfer this data frame to destination. So, it's essential for the router to choose the best path, i.e. routing arithmetic. In order to finish this function, many transferring paths, i.e. routing table, are saved in the router, for choosing when needed.

Routing Table

Destination IP	Subnet Mask	Gateway	Metric	Interface
192.168.100.0	255.255.255.0	0.0.0.0	0	eth2.2
192.168.0.0	255.255.255.0	0.0.0.0	0	bn0
0.0.0.0	0.0.0.0	192.168.100.100	0	eth2.2

Refresh

Static Route

Static Route is set by administrator in advance is called static route. Usually, it is set according to network configuration when installing the operation system. It would not be changed according to network structure's change.

Destination LAN IP: The address of the remote host with which you want to construct a static route.

Subnet Mask: The network portion of the Destination LAN IP.

Gateway: The gateway of the next hop.

Static Routing

Destination LAN IP	Subnet Mask	Gateway	Action

Chapter 12: System Tools

Time

This section is to select the time zone for your location. If you turn off the Router, the settings for time disappear. However, the Router will automatically obtain the GMT time again once it has access to the Internet.

Time Zone: Select your time zone from the drop-down menu.

Customized time: Enter the time you customize.

DDNS

The **DDNS (Dynamic Domain Name System)** is supported in this router. It is to assign a fixed host and domain name to a dynamic Internet IP address, which is used to monitor hosting website, FTP server and so on behind the Router. If you want to activate this function, please select “Enable” and a DDNS service provider to sign up.

DDNS: Click the radio button to enable or disable the DDNS service.

Service Provider: Select one from the

drop-down menu and press “Sign up” for registration.

User Name: Enter the user name the same as the registration name.

Password: Enter the password you set.

Domain Name: Enter the domain name which is optional.

Backup/Restore

The device provides backup/restore settings, so you need set a directory to keep these parameters.

Backup: Click this button to back up the Router’s configurations.

Browse: Click this button to browse the directory where you Back up or save files.

Backup/Restore

The device provides backup/restore settings, so you need set a directory to keep these parameters.

Please choose restore file:

Firmware Upgrade

The Router provides the firmware upgrade by clicking the “Upgrade” after browsing for the firmware upgrade packet which you can download from www.tenda.cn. After the upgrade is completed, the Router will reboot automatically.

Browse: Click this button to browse the directory where you download the firmware upgrade files.

Upgrade: Click this button to start upgrade.

IMPORTANT: Do not power off the system during the firmware upgrade to avoid damaging the device. The Router will reboot after the upgrade.

The screenshot shows a web interface titled "Backup/Restore". The text reads: "The device provides backup/restore settings, so you need set a directory to keep these parameters." There is a "Backup" button. Below that, it says "Please choose restore file:" followed by an empty text input field, a "Browse..." button, and a "Restore" button.

Restore to Factory Default Settings

This button is to reset all configurations to the default values. It means the Router will lose all the settings you have set. So please Note down the related settings if necessary.

Restore to Factory Default Settings: Click this button to restore to default settings.

Factory Default Settings:

User Name: **admin**

Password: **admin**

IP Address: **192.168.0.1**

Subnet Mask: **255.255.255.0**

⚠ **NOTE: After restoring to default settings, please restart the device, then the default settings can go into effect.**

Reboot

Rebooting the Router makes the settings configured go into effect or to set the Router again if setting failure happens.

Reboot the router: Click this button to reboot the device.

Change Password

This section is to set a new user name and password to better secure your router and network. Please Note that the new password should be less than 14 characters.

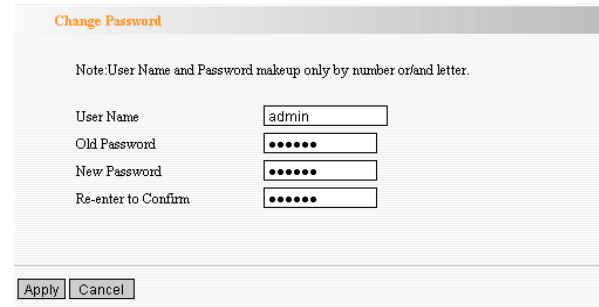

User Name: Enter a new user name for the device.

Old Password: Enter the old password.

New Password: Enter a new password.

Re-enter to Confirm: Re-enter to confirm the new password.

⚠ NOTE: *It is highly recommended to change the password to secure your network and the Router.*

System Log

The section is to view the system log. Click the “Refresh” to update the log. Click “Clear” to clear all shown information. If the log is over 150 records, it will clear them automatically.

Refresh: Click this button to update the log.

Clear: Click this button to clear the current shown log.

The screenshot shows the 'System Log' interface. At the top, it says 'System Log' and 'Page 1 content'. Below this is a table with 10 rows of log entries. Each row contains a sequence number, a timestamp, a protocol name, and a description. At the bottom right of the table area, there are navigation links: '1' (highlighted), '[2]', and '[3]'. At the bottom of the interface, there are two buttons: 'Refresh' and 'Clear'.

Appendix A: Product Features

- ◆ Integrates router, wireless access point, four-port switch and firewall in one
- ◆ Complies with IEEE802.11n, IEEE802.11b and IEEE802.11g standards
- ◆ MIMO technology utilizes reflection signal to increase eight times transmission distance of original 802.11g standard and reduces the "dead spots" in the wireless coverage area
- ◆ Provides 300Mbps receiving rate and 150Mbps sending rate
- ◆ Supports WMM to make your voice and video more smooth
- ◆ Supports 64/128-bit WEP, WPA, WPA2 encryption methods and 802.1x security authentication standards
- ◆ WPS (PBC and PIN) encryption method to free you from remembering long passwords
- ◆ Supports remote/local Web management
- ◆ Supports wireless Roaming technology and ensures high-efficient wireless connections
- ◆ Supports wireless SSID stealth mode and MAC address access control
- ◆ Supports Auto MDI/MDIX
- ◆ Provides system log to record the status of the router
- ◆ Supports MAC address filtering, NAT, NAPT
- ◆ Supports UPnP and DDNS
- ◆ Supports the access control over 30 MAC addresses
- ◆ Supports DHCP server/client
- ◆ Supports SNTP
- ◆ Supports virtual server and DMZ host
- ◆ Supports auto wireless channel selection
- ◆ Supports WDS function (wireless distribution system)
